^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

No need to be that extreme ... just install Linux/X on it, and use it
to run STonX. ;>

Now if STonX would work with Magic we could forget most of this
silliness ...

RFC-1036 clearly states in section 2.2.5, that the References: header is
required for all follow-up messages. Maybe someone should start sending
a copy of RFC-1036 to the author of Oasis, once every day, until that idiot
reads and implements the standard.

> Yet every time somebody
> follows-up an article using Oasis, Free Agent thinks they've started a new
> thread - as do a billion other _real_ newsreaders. Sadly, few Oasis users

> know any better.

I think this destruction of Usenet (Oasis is by no means the only broken
newsreader) could be stopped, if the news server software would reject any
non-conforming articles. If it would, nobody would use the broken reader
software.

Luckily for us, the author of Oasis appears to think that generating an
X-Newsreader: header _is_ important; and I appear to think that putting
a line `/x-newsreader: *oasis/h:j' in my global killfile is a nice
workaround. :->

I spent a long time just trying to fuse and fluxcage him with the
firestaff. I don't know how long it's supposed to take.....Do you have
to do anything with the four elements that you find on level 7 (earth, air,
fire, water)? I thought that must be the missing clue....
Also, I can't seem to find the E key which opens the very bottom of
the long staircase. I've mapped the entire dungeon, but obviously I missed
something :)
Thanks for trying to help, anyway.

1810. Re: Falcon Monitor

Newsgroup: comp.sys.atari.st
Date: 1995-11-11 00:00:00 UTC
From: ae@yin.kuai.se
Message-ID: <48138t$v11@bundy.mdk.se>
Source record: 156353

Paul Luscher (pl4266@u.cc.utah.edu) wrote:
: What monitor can I use to display all modes on a Falcon ?

For enabling all resolutions (including thoose of screen enhancers),
you need a Multisync capable horizontal freqs of 15-45khz and vert freqs
of 50-~100hz. These are very expensive and hard to find.
Such a monitor will display all RGB/TV and VGA modes.

: If it's SVGA, do I need special Plug ins to make this work ?

Well, you need a normal VGA adapter, available at any Atari store.

: Does my computer run slower in 768 X 400 or in 1024 X 1024 than on my VGA
: monitor doing 640 x 480 ?

Yes, the higher the resolution is, the more the videl chip needs to
collect data from RAM, and doing more of that, slows the BUS down.
And to get the very high resolutions (ie, 1024*768) you need a Videl
accelerator (Screenblaster, BlowUp etc).

: Can RGB display all modes even higher than 768 x 400 ?

RGB can display this without any additional programs:
1, 2, 4, 8, 16 bit modes: 320*200, 320*400il, 384*240, 384*480il
640*200, 640*400il, 768*240, 768*480il 50/60hz

With extra software (Videl inside for example) you can exapand the
1, 2, 4, 8 bit modes to 1664*300 or 1664*600il. (50hz)
While the 16 bit mode ends at 832*300 or 832*600il. (50hz)
Please note that most screens does not show all 300 lines, this has to be
experimented with for each case, since even the same type of monitor
can vary from time to time.

1813. Re: MagiC 4.0 available

Newsgroup: comp.sys.atari.st
Date: 1995-11-11 00:00:00 UTC
From: oberle@infko.uni-koblenz.de
Message-ID: <482j3j$jp9@newshost.uni-koblenz.de>
Source record: 156356

Just to make some things clear ...

I had posted the original message about MagiC 4.0 being available.
This information was taken from an official ASH newsletter. These
newsletters are sent regularly to every registered customer of ASH
(like me: Pure C, MagiC, Kobold). There shouldn't be any doubt that
this information is absolutely true.

As MagiC is a german product and ASH is a german distributor, it should
be clear that version 4.0 currently is available in German only. I don't
know when it's going to be translated for other markets.

Let me point out the new features again:

- runs on every ATARI, including Falcon
- supports Falcon specific color modes and the Falcon DSP
- booting from IDE HDD possible
- new, advanced fileselector
- online scrolling in windows
- new keyboard shortcuts e.g. to "fade out/fade in" applications
- ACCs can be installed/removed dynamically
- built-in fontselector that applications (like e.g. ST-Guide)
can make use of
- new VT-52 emulator
- MagiC-Desk completely renewed

- background HDD and FDD access has already been available since Version 3.0;
however, not every hard disk driver can handle this- but e.g. HD Driver and
the latest version of CBHD (does anyone know whether HuSHI allows this?)

- since Version 3.0, the basic capability to handle alternative filesystems
is included. But no alternative filesystem is delivered with MagiC. The
MINIX filesystem for MiNT cannot be used. :(

- and there also is still no (optional) memory protection, as offered by
MiNT. Is this really so difficult to implement? I don't know.

MagiC 4.0 will be presented on the ProTOS '95 in Hennef near Bonn (Germany).

Bye,

Chris

Cos I'm using an Atari and us Atarians don't have a gopher client
(yet!)

Except possibly with MiNT but then I don't use MiNT.

Yes well of course you save money when it does not have to go through
a distibution chain.

The point I was making is, if you subscribe directly, and therefore
deny local traders their cut, don't go whinging when they stop
stocking the mag.

Don't know why you still bother with hdx and ahdi. If I were you, I'd get
SCSI-Tools and HuSHi (yes, I know, the name is dreadful). Never had any
problems with it on any of the discs I use, and it is much more flexible
than the Atari HD utilities. I even use it to format Linux/68k partitions.

>don't violate any licenses. In fact, Atari U.S. gave their full blessing
>to this scheme over 3 years ago when I was first designing the
>Gemulator.

Gemulator allows you to run multiple instances of itself under Windows '95
... so effectively there are several STs running simultaneously.

:>What you don't have is any authorization from Atari to allow users to
:>run multiple instances of their ROMs, and by today's definitions of what
:>is piracy and what isn't, to require people to dump ROMs from an
:>operating Atari computer is considered piracy.

why is running two or five copies of gemulator simultaneously not piracy?
it *is* by your definition.

:>It's a further black eye to the Atari community that many of the users
:>in this newsgroup are blatantly discussing how they pirated their TOS
:>ROMs. This is not something that looks good for the Atari community,
:>will not attract new developers or keep existing developers around much
:>longer, and it certainly doesn't help the few remaining Atari dealers
:>around to stay in business when an amoral developer such as yourself
;>chooses to do what you are doing.
:>Since you chose not to discuss this with me in private email as we were,
:>I am explaining my position in public. The fact that many of the users
:>of this newsgrooup don't agree with what I'm saying doesn't surprise me
:>since my straight-to-the-point attitude doesn't go over as well as the
:>sugar coated messages other developers post, but it doesn't make your
:>product any more legal.
:>The reason Gemulator requires a hardware card, the reason Magic Sac
:>required a cartridge, the reason Spectre required a cartridge , the
:>reason Janus requires a card, and the reason other emulators require
:>hardware of some sorts is specifically to stay legal.
:>As I asked you several months ago, what alternate method, legal method,
:>do you have to allow your users to use your product. Your answer so far
:>seems to be "none". You have no legal standing to distribute your
:>product.

1. STonX is not distributed with ROMs. Therefore it is not illegal for us
to develop and distribute it.
2. STonX can be run legally so long as original ROM and copy are not used
simultaneously.

You agree with this, so therefore your only argument is that potentially there
could be 'piracy' going on. Your only justification for this is innuendo and
stereotyping of Atari users.

Wouldn't you get a "suspicious pointer conversion" on the line
with gets(&s), if s is declared as char *s? Should be:

char *s;
s = (char *) malloc(MAXINT);

The TT's Hi-Res monitor takes ECL outputs which the Falcon doesn't do. So IMHO and AFAIK - it won't work, regardless of whether the frequencies are right or not.

:-(

I've seen STonX on a DX4-100 also. A little slow too - but seemed just
about usable. No real incentive to use over a real Atari however.

I hope STonX development does continue though. It might prove very useful
in a couple of years time - when faster hardware might allow it to emualte
a TT or Falcon at full speed.

:-)

Roland.

Claes Holmerup (claes.holmerup@p5.dada.ct.se) wrote:
: Hi there! Good initiative and PLEEEEEAAASE all demo and game programmers:
: make ALL your work executable on VGA-systems and NOT RGB ONLY!!!!!
: I believe that most Falcon users have VGA monitors.

When most users have VGA monitors, almost all have access to RGB or a TV.
And really, RGB/TV modes offer better graphics modes and a slightly
faster system, so why not use all the possibilities of the Falcon when
making a demo (which isn't commercial anyway), instead of doing a product
being not as polished as it could be.

I don't know if you want details, but some things VGA doesn't offer are;
- Cinemascope ("stretched" pixels) only needing 288 pixels screen for fine
TV overscan.
- Double pixelsize (giving half the amount of Y lines. There is a VGA
equailent for this, but doubling the pixelsize in the X axis instead,
which is slightly slower, and needs double routines (separate for
RGB and VGA).
- Newly invented RGB/TV truecolour hardware fading, not possible at all
on VGA screens.

And then pointing out all demo competitions today only requires RGB
operation. Why then make a demo which works on VGA, which could be better
as RGB only, and have less chance to gain a good position in the voting?

I do however agree that commercial games should work on both monitor styles.
Since you then have to purchase money for them. And if a demo should work
on VGA, great for the VGA owners, sad for RGB owners (they get a less
impressive product).

I should also say I use a VGA monitor myself almost all the time, but it
doesn't bother me very much to switch over to RGB when viewing a demo.

WANTED!: FALCON SOFTWARE DEVELOPMENT & MARKETING COMPANY

Nov 11, 1995 - 1.0

---

1. INTRODUCTION

TECNATION DIGITAL WORLD, the creators of the BiT BOPPER Dynamic Graphics from Audio software for the Atari / C-Lab Falcon are seeking a 3rd party company to take over the development and marketing of this innovative product.

The software is at release 1.5b, which is stable and had been well received by our initial customers.

---

2. YOU

If you think you can take on BiT BOPPER and continue to develop it, and market it world-wide on the Atari / C-Lab Falcon, we would like to here from you.

Requirements:

- You must be competent
- Previous experience with the Falcon
- Previous experience with the markets BiT BOPPER is targeted towards
- You must have the financial resources to further develop and promote BiT BOPPER world-wide
- You must have the ability to create high quality marketing material to backup the innovative and eye-catching nature of BiT BOPPER
- You must have a world-wide web site, or you may use our site to promote BiT BOPPER until you get your own. (The URL for ours is shown later in this document.)

---

3. QUESTIONS AND ANSWERS

- Why is Tecnation looking to pass on BiT BOPPER?
We are now too busy with other ventures, but firmly believe the market for BiT BOPPER is ready for exploitation - which is why we are keen to keep the product alive!

- What are the financial details?
We will require an advance payment, followed by royalties. All negotiable.

- What will you receive as part of the deal?
We will provide our development system, and all source code, documentation
and user documentation.

- What technical support will Tecnation provide?
We will provide some up front technical support to help with any transition.

- What about Mac and PC versions of BiT BOPPER?
This is negotiable.

- What specification Falcon does BiT BOPPER require?
4Meg of RAM and at least 10Meg of hard disk space. Audio input. MIDI IN.

- How many Falcons are their in the world?
Approx 100,000. However, now C-Lab are building them, the installed base
will grow.

- Was BiT BOPPER sold under a different name before?
Yes. Falcon BiT BOPPER was previously sold as SONOVISTA, but not any more.
It is known as VIBRAVISION in Germany, however, we ask the name BiT BOPPER
is used globally to simplify matters.

Hi Mike! :-)

(Nice to see you) ;-)

Years ago, i have orderd my TOS 2.06 in Germany by H&S
The TOS 2.06 is comming up in two Chips.

I have include a TOS Card in my old 520ST
This Card have no Jumpers to select Chips.

What is a Wizztronics Card?

Best Regards
Robert

I have both the Link and the Link II. BOTH are able to
operate "regular" SCSI devices quite nicely. There is
little difference between the two aside from a light,
bus termination power and parity setting.

Mike

1843. WARNING!! Win95 files...

Newsgroup: comp.sys.atari.st
Date: 1995-11-11 00:00:00 UTC
From: chriswil@southern.co.nz
Message-ID: <4821f2$ndu@southern.co.nz>
Source record: 156430

Hi Everybody...

This is a general warning to ALL ATARI HARD DRIVE USERS...

I have imported some files from a Win95 PC to my Falcon. They were originally in long name format, but were chopped to 8.3 when I dumped them to floppy disk. The way Win95 writes FAT info to an MS-DOS disk is now no longer entirely MS-DOS (as an Atari would see it) compatible. I believe that the extended FAT info that Win95 writes to floppy/HD now is likely to confuse TOS, and as a result your FAT/BPB may be damaged irreparably as has happened to me :-(.

I suggest that Atari HD owners DO NOT import any (formerly) long name format files from Windoze95 machines at the risk of lost data.

Ciao, Chris W.

1844. Re: Atari On-Line Mags

Newsgroup: comp.sys.atari.st
Date: 1995-11-11 00:00:00 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <B3OFaEt.ari2550@delphi.com>
Source record: 156431

Regarding Atari On-line Mags...

Why are they so Jag-centric? Sure, the Jag is nice but its pretty clear by now that the system is not going to inspire Atari to re-enter the computer market.

I remember a time when the Atari on-line mags focused on the 8bits and the ST/TT/Falcon exclusively. The Jag has its place but I really don't give a sh*t about the newest Jag release, etc. Should I want that info, I'd read rec.games.atari and read one of the many commercial gaming mags.

The ST line has been in decline for as long as I remember and yet, there is always something happening with it - so, there's always something to write about - rather than just writing 95% Jag content and 5% ST content.

Now, I haven't been an Atari owner for almost 18 months but having spent 7+ years and several thousand $ on hardware and software, I still like to follow the happenings of one of the best machines ever made. Since I spend A LOT of my time on-line, the on-line Atari mags are one of the best sources of info for me - now they are just a waste IMHO.

I don't know about TOS incompatibilities with Win95 but I have heard some horror stories with it and its VFAT system so I won't touch it.

I'm not qualified enough to talk about it much - apparently, you can tell Windows to write files as compatible FAT or to the new VFAT system. It is true, however, that Win95 will write to the boot sector of your floppy and HD if you elect this option. Personally knowing the frustration of boot sector viruses and HD failures, I don't trust anything that writes directly to the boot of *any* disk unless its coming from Norton or Central Point software (and even then I start to sweat!).

Ari,

Personally speaking, and I'm sure that Travis would agree with me somewhat, we'd love to have more computer-related news in our magazines. We have an all-volunteer staff for one thing. Atari computer news is not all that prevalent these days - I wish it were better. I'd love to have people, especially really knowledgeable/active people here on the Net, write some original articles and reviews - interested? The dominant news from Atari these days is Jaguar; and most of my present staff these days don't even own an ATari computer. A couple of years ago, it was much different! <sigh>

If people here are interested in submitting articles, reviews, memories, etc. - I'd be more than happy to include them in STReport. I do what I can with the
limited time and resources at my disposal - I hope the news improves.

I know this not a great deal of help, but I have several times output Pagestream postscript to a (Mac) bureau successfully - even did a 30 page booklet! Apart from checking the obvious (load PS driver - print to disk), the bureau did have some problems initially reading the disk I gave them. This was solved by using Diamond Format v2.3 which gives you the option to format to Apple File Exchange. Once I used that to format the disks, all was well. Since I've not had any trouble (apart from the disk format thing), I'm not sure what else to suggest (apart from perhaps using Ghostscript to check the file).

You MAY have lost these
files.

rg> It also reports that Cluster(xx
unused
rg> and
links
rg> to xx)
?

A "lost" cluster which you can
regain.

rg> Q. Should i be
worried?

Not really - but those files with bad chains may be
irrecoverable.

rg> Q. If so what do i do to rectify the
problem.

Your disc de-fragger (CHKSHELL?) should offer the option of "repair" for
the bad chains and "recover" for the lost cluster. If it doesn't then use a
better one (CHKDSK or STTOOLS). You may get back all or parts of the badly
chained
files.

1858. Gemulator experiences

Newsgroup: comp.sys.atari.st
Date: 1995-11-11 00:00:00 UTC
From: eretic@tiac.net
Message-ID: <4831cv$1i3@sundog.tiac.net>
Source record: 156445

I have just recieved both Gemulator 3.0 and 4.0 this Thursday, and having had read the manauls front to back several times before I even installed the card. Since the computer was in the middle of a long tape operation; I had time to kill.

I ordered 3.0 at the same time as the 4.0 upgrade, not knowing that there was a 3.0 on the Gem. 4.0 discs, known as Gem4dos. I installed that one first, and found it was quite fast, and would even boot my games floppies! But there was absolutely no joystick support, painful to see ST Raiders on my DX4-100, and with sound, but no joy.

I had tried several games, most would boot, yet only a few would play mainly becasue of the joystick issue. I got the nerve up to install Calamus and Timeworks publisher in monochrome mode.

These worked flawlessly, and were installed in a virtual drive D:

So, about 3 hours later, I decided enough. So I installed Gemulator 4.0 to see about that joystick support I read in the manual (although the pamphlet attachment -readme.txt- had stated that joystick and midi was still buggy).

I selected the TOS 1.0 roms, and selected (Use Virtual Hard discs)

well that was a mistake as I got several atari bombs across the screen, and required a reboot, I tried just about every setting, and found that anything using the virtual hard discs I just created and installed the DTP programs will cause those bombs.

I delected the boot from hard disc, deselected "use .hdv" and selected everything need for
gameplay, the sound, joystick, and fast screen updates, to use with TOS 1.0

I got the ST low res screen, now I can't access drive A: either. with any floppy. No A:, no C:, nothing, so, I went back to th emulator window, and selected TOS 2.06, and rebooted
now I can access drive A: (but only if drive A: has a msdos boot dector).

Well 99% of my discs don't have an MSDOS boot sector as I bought one of the 1st Atari 520st's with the TOS 1.0, and later bought a MEGA 2 ST, witht he TOS 1.2 ROMS, so any disc I formatted back then, was obviously not going to be MSDOS f*cking compatible). So I even went and use MOSDOS utility, going back to GEM 3.0 to do so, on a few of the floppies).

WEll all in shot, I could get any games to work, with any sound, and there was no joystick support working for me. I checked the windows '95 control panel to see what was up, I recalibrated the joystick, checked my

sound settings, even
played a few Windows, and DOS programs to check my audio output) My
sound blaster 16 card was fine)

I couldn't see why Darek abandoned the Gem 3.0 entirely for Gem 4.0, as
Gem 3.0 was a much better gaming environment, it supported the TOS 1.0 ROMS
file, would boot any floppy that was not copy protected, and the sound
actually worked. If he had gone one step farthur and provided simple
analog PC joystick translation for the games, I would never use Gem 4.0, as
I can't get Gem 4.0 and Gem 3.0 environments to talk to one another,
except for the exchange of floppies, that's all they held in common.

Now if anyone else has had better experiences with these 2, please let me
know, via E-mail or post to the group.

Thanks

Eric

: --
I having jusg gotten Gemulator 3.0 and 4.0, and just yesterday received
STonX over IRC, I would like to get some info on how to dumo the TOS 2.06 and
TOS 1.0 ROMs that are on my gemulator card, aas Gemulator is p*ssing me
off. I'll have to install linux again, but I don't care.

What version of the Linux kernel is needed to run? and what is the system
requirements of STonX?

Also, can you post a program to dump the TOS 2.06 rom from my Gemulator
card reader, as I'm not breaking any copyright vioulation if I'm not running
Gemulator and Stonx at the same time, and I have no REAL Atari in the
house, so that is a dead issue.

Eric

1860. ST ZIP 2.6

Newsgroup: comp.sys.atari.st
Date: 1995-11-11 00:00:00 UTC
From: epp@world.std.com
Message-ID: <DHwD0E.Mwu@world.std.com>
Source record: 156447

I have been using ST ZIP 2.6 in conjunction with a few different QWK offline reader programs on an ST with 2.5 Mb of RAM.

The BBS that has a QWK door, currently uses PKZIP and PKUNZIP 2.04g to compress and decompress the message files and uploaded replies.

ST ZIP will decompress the *.QWK file with no trouble, and I am able to read and reply to all of the messages. The problem is that after the .REP file is uploaded back to the BBS, I receive "Not ZIP implode format, unable to process." errors.

Does anyone know if ST ZIP 2.6 is not fully compatible with the latest versions of PKZIP and PKUNZIP? I cannot understand why ST ZIP will correctly unzip the message file, but will not correctly zip the replies file.

Would appreciate any suggestions. Thank you.

>
Not true -- I format double density disks on the MAC all of the time. It
needs to be a double density disk though -- if the MAC sees it is a high
sensity disk it will format it as a high density -- I don't think it allows you
any choice.

:: >void main() {
:>
:>: Sorry, this is not ANSI C. It's not even C!

:ooops is right. It even compiles...
:(gcc w/ the -ansi flag even...)
:Seems kind of strange that some people wouldn't know C code from a
:hypercard stack doesn't it? What a crazy world we live in.

In short if the program requires a standard startup stub. It requires
a function int main(); otherwise its main routine can be called anything
you want. Using the atari tos as an example:
#include <osbind.h>
foo()
{
Cconws("Hello World\r\n");
Pterm0();
}

is an ansi compliant C program. Provided the compiler does not call
library routines dependent on the start up stub in the invocation of foo.
if cc -c foo.c ;ld foo.o works it is legal ansi.

but #include <stdio.h>
void main(void)
{
puts("Hello world");
}
is not! Both will compile on an ansi C compiler. But puts requires
intialization of the startup stub to setup stdout.

That is the essence of what the standard actually says. In fact it is
a bad habit to return a what have you return code from main(). return 0
generates what a moveq #0,d0 ? I have had programs like make stop cold
because a program returned what ever happend to be in d0 and it was not
zero.
```

BTW why is this flooding the net??? It really belongs in comp.lang.c
but I quit reading that group...

I'm hoping that some of you knowledgable computer enthusiasts might help me with a problem I am having. I just received a brand new registered version of ESS code in the mail the other day. It included ST guide, Masterbrowse, Accpad, Autodate 11, M_Print10 and Shdwterm 11. I can't figure out how to put all of this stuff together so it will uncode some files I have saved on the Freenet and to disk. I would appreciate all the help I can get and feel like a total retard! thank you very much in advance. Ron L.

1867. Re: ST ZIP 2.6

From: gregor@shelly.goldengate.net
Message-ID: <bb7cb$131730.1d2@goldengate>
Source record: 156254

I've been using STZip 2.6 for a similar purpose and have had had no
problem with it. Maybe the problem is not with STZip but with your
QWK program. When I first started to dl QWK packets, I had a similar
problem. at that time I believe that I was using a program called(?)
ST Quick. I could dl the packet reply to my heart's content, but when I
attempted to ul the packets to a bbs *their* SW could not decode the
.rep with out some fancy file editing by the sysop. I switched over
to Mountain 2.6 and this elliminated the incompatibility problems,
which stemmed from the differences between the st version of the rep
and the Bluewave versions that seem to be popular these days.
a question...You aren't using ST Zip on the rep packets are you?
This is not necessary! Only the QWK dl is archived.
Mountain is shareware and supports both qwk/rep formats. It is a great
program and very easy to use. I recomend it... I found it on GEnie but
it must be available elsewhere.

>a copy of RFC-1036 to the author of Oasis, once every day, until that idiot
>reads and implements the standard.

Not to mention RFC-822, so future versions of Oasis might possibly generate an In-Reply-To: header. It was enough of a struggle to convince Phil to add "Re:" before subjects; even now it's only there as an option. I reckon the crowning glory is that when you send mail to multiple recipients, it silently adds "This is a Mail Shot to everybody on the [...] Mailing List" to the message body. Practically since it was released, I've led a one-man campaign on demon.ip.support.atari against Oasis' heinous behaviour and blatant non-adherence to standards. But everybody else has vigorously defended it, presumably because it's not too complicated and runs under GEM.

>I think this destruction of Usenet (Oasis is by no means the only broken
>newsreader) could be stopped, if the news server software would reject any
>non-conforming articles. If it would, nobody would use the broken reader
>software.

Quite. Sadly, it seems that the fact that servers are usually so lenient about what they accept only goes to encourage the development of shoddy software.

>Luckily for us, the author of Oasis appears to think that generating an
>X-Newsreader: header _is_ important; and I appear to think that putting
>a line `/x-newsreader: *oasis/h:j' in my global killfile is a nice
>workaround. :->

(: But then you'll miss the admission of defeat in the grand Oasis 2 hat-eating challenge! (Only five months to go; will Spider, the severely pre-announced Web browser, appear in time?)

I should really set followup-to misc.test, and then any outraged Oasis users would be up a gum tree when they tried to post witty retorts along the lines of "OASIS R00LZ!!!"

Hi Steve,

Try ftp.uni-stuttgart.de:

<FTP EMAIL> response

NEW: ftpmail now runs ftpmail-1.23. Send a mail if you find any problems.

WARNING: The wwwmail part of ftpmail seems to have serious problems
retrieving www data. Do not use it until this warning is missing.

ftp.uni-stuttgart.de is the local machine. It stores 25 GB of sources,
codes, infos etc, so please use ftp.uni-stuttgart.de for your first
steps in ano-ftp-land. This is the default if you use the
open command without any parameters.

Requests to access ftp.uni-stuttgart.de are handled before any
other site to keep the traffic down and response times fast.
(Thanks to Axel Dunkel ad@cat.de for the idea!)

If there are any problems, please send me a note about it.
Fan mail is accepted as well 8-)

Good Luck ! PI (ftpmail-adm@ftp.uni-stuttgart.de)

P.S.: Send a mail to fund@stonehenge.com to learn about
the legal case of Randal Schwartz, who was indicted
because he tried to make Intel, Inc. computers more secure.
He is a famous perl hacker and needs every support you
can send him.

ftpmail(1L) LOCAL MANPAGES ftpmail(1L)

NAME
ftpmail - Uni Stuttgart's FTP/WWW mail service

DESCRIPTION
ftpmail@ftp.uni-stuttgart.de fetches files from anonymous ftp servers

or files from HTTP servers and sends them back via electronic mail.

ftp.uni-stuttgart.de is the local machine. It stores 25 GB of sources,
codes, infos etc, so please use ftp.uni-stuttgart.de for your first
steps in anonymous ftp-land. This site is the default site if you use
the open command without any parameters.

Good Luck ! PI (ftpmail-adm@ftp.uni-stuttgart.de)

OPTIONS
Valid commands to the ftpmail gateway are:
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

path email-address
reply-to email-address // Who to send the response to. This is
// optional and defaults to the user's email
// address

Followed by one of:
~~~~~~~~~~~~~~~~~~
help Just send back help. This will abort any other
processing of the request.

delete jobid Delete the given job

silent Silent processing of request.
If you want to have silent processing of your
request (no ACK, no xferlog, no status mails),
insert before the open the silent command.

open [site [user [pass]]]
Site to ftp to. Defaults are
ftp.uni-stuttgart.de anonymous reply-to-address.
Attention:
Only if there was an open, then it can be
followed by up to 100 of the following
commands. ftpmail will try up to $max_tries
times to get the file.
Activates ftpmail state.

login user pass Site to access via basic authentication HTTP.
Username and password are *required*.
Activates wwwmail state.

cd pathname Change directory.
Works only in ftpmail state.

ls [pathname] short listing of pathname. Default pathname is
current directory.
WARNING: The complete ls -lR of the local
site is approx. 50 MB, don't try to transfer.
Get one of the /SITEINFO/filelists/ files
instead.
WARNING: Getting a ls -lR listing is disabled

because of persistent abuse.
Works only in ftpmail state.

dir [pathname] long listing of pathname. Default pathname is
current directory.
Works only in ftpmail state.

get fileorURL Get a file or URL and email it back.
WARNING: trailing blanks are *not* ignored.
WARNING: wildcards do *not* work.
WARNING: Somehow, this does not work most of
the time. Do not try it until this notice vanishes.
If no open command was issued, interprets
parameter as URL.

compress Compress input before emailing back

gzip Gzip input before emailing back

uuencode
vvencode
btoa These are mutually exclusive options for
converting a binary file before emailing.
(Default is uuencode.)

force uuencode
force vvencode
force btoa Force all input to be
encoded before sending back.
There is no default.

mime Send the message as a Mime Version 1.0 message.
Text will be sent as text/plain charset=US-ASCII
Non-text as application/octet-stream.
If the file is split up then it will be sent as a
message/partial.

force mime As mime but force text files to be sent as
application/octet-stream

no [compress|gzip|uuencode|vvencode|btoa|mime]
Turn the option off.

size somenumber [b|k|m|B|K|M]
Set the max size a file can be before it is
split up and emailed back in parts to the
given number of kilobytes, megabytes or bytes
Default is $def_max_size byte, but is limited to 262144.

mode binary
mode ascii Change the mode selected for the get command.
Defaults to binary.
Works only in ftpmail state.

// Retrieve a http file

CAVETS
The ftpmail-service ignores jobs from the following addresses:
$dont_reply_to

The ftpmail-service ignores *any* job that contains the string:
$ftpmail_response

NOTES
[] To ease the decoding of multipart mailings, every part is enclosed
by the lines

ftpmail-begin
<stuff>
ftpmail-end

[] This can be used to automatically decode e.g. uuencoded mails. Save
all ftpmail mail into a file and type:

sed '/^ftpmail-end/,/^ftpmail-begin/d' < file | uudecode

It will concatenate the files into one file; delete all lines
between all 'ftpmail-end' and 'ftpmail-begin' couples and uudecode
the file.

There is a software available (using perl) that automatically
extracts ftpmail answers out of your mailbox into files.
Check ftp://ftp.uni-stuttgart.de/pub/unix/comm/ftp/mailex-1.0.tar.gz
Thanks to Rainer Wiesenfarth, wst@v-ppb.zeiss.de for the code !

[] The ftp-server ftp.uni-stuttgart.de is capable to convert whole
subdirectories into one tar file that gets send to the requesting
user. Just use

get directory.tar
get directory.tar.gz

to fetch files. This does only work on ftp sites using the
wuarchive ftpd and enabling this feature, like
ftp.uni-stuttgart.de does.

[] Requests to access ftp.uni-stuttgart.de are handled before any
other site to keep the traffic down and response times fast.

PROBLEMS
If you have problems please email ftpmail-adm
and quote the following line:
$Revision: 1.23 $
```

Fan mail is accepted as well 8-)

CREDITS
[] Requests to access ftp.uni-stuttgart.de are handled before any
other site to keep the traffic down and response times fast.
Implemented from an idea of Axel Dunkel, ad@cat.de.
[] The silent option for silent processing of your request was
proposed and implemented by sws@tora.robin.de, Steffen W.Schilke.
Thanks.
[] This readable man page was provided by Christian Aschenbrenner
(ca@brennix.kn.sub.org) after he figured out what the
former help file said. Thanks.
[] The code to access HTTP server was taken from htget-1.1,
from Nate Sammons, nate@matisse.vis.colostate.edu. Thanks!
[] The mailex software comes from Rainer Wiesenfarth,
wst@v-ppb.zeiss.de. Thanks for the code !
[] The daily work to keep this service running is done by
ftpmail-adm@ftp.uni-stuttgart.de (currently Kurt Jaeger,
pi@rus.uni-stuttgart.de). Without the constant effort of
such system administrators public access services would break down
even sooner than later. Cheers.

CA Last change: Aug '95 []

From: rob@nbnet.nb.ca
Message-ID: <816202750_OASIS_@nbnet.nb.ca>
Source record: 156269

Hi,

I think that the 720k floppy drive is dying in my 1040 STe. It grinds like hell, still seems to read and write disks but it definitly sounds like it's on its' last legs.

Can I replace it with a generic PC 720/1.4 floppy drive? Plug and play as it where or do I need an ATARI specific disk drive, special chip or cable?

Do dips need to be set, the room rearranged or sacrifices made? I know less than nothing about this and would appreciate any help that anyone could lend.

Thank's

Rob (soon to be floppyless I fear)

Not many programs save in the .TPI format. If you wish to
create a .VID color video on the Falcon, you will eventually
go back to TP to save your work so it can be imported by
VideoMaster Falcon. True Image <WILL NOT> save in the TPI
format even though the option is there. You will get an
error message. For this, I found TP useful.

Make sure you're using the latest version of the Specci emulator, V2.07.
That can handle the .SNA and (through conversion) .Z80 files that
ftp.ijs.si held the last time I was on
there.

The older version of Specci used its own format which, like you suggested,
is incompatible with these formats. Look for ZX_SP207.ZIP, as there's a
dodgy archive that doesn't uncompress with the correct file
hierarchy.

Well, well, well. I am not the only one!
I had this problem for months. Turns out that the version of pkzip
that the BBS was using was the incompatible one. It reported that
there was "no apcbbs.msg file in packet".

Post this message to fchan@acpu.com, the sysop of the board I use.
He fixed the problem (I don't know how). He can fill in your sysop
on all the grisly details. He may take a while to answer - busy on
several fronts.

Hope this helps!

As far as I know for sure, monitors are the main concern, although I
paid customs duties for the whole lot, at about 3% of declared
value, IIRC. It was the slowdown and hassle about the monitor, and
the other charges (the broker's fee, etc.) that made it so painful.
I have been *told* that software *cannot* be shipped across the
border, but I believe that this is simply untrue.

You may have to get some sort of Atari DOS on ST-Xfomrer, though the only use I see for it is conversion between 8-bit and ST files. Of course, PC-Xformer comes with some DOS's on the virtual disk files. But you can copy even cracked files of cart games on his emulator and it's "legal". Go figure...

Keep the PC only if you can't do a task on the ST. Geez, if you only get products from people who are nice & friendly to their customers(and not try to be macho compared to the competition), you wouldn't have anything PC at all.

I find that in the year I have been out of the Atari
scene has actually brought very nice things. The multitos which
came with the falcon sucked. Now with MH-mint 1.12 it's usable
but slow on a TT. (i guess I need NVDI) miniwin is working and
minix and thanks to thing and freedom I have long file name
support. Freedom is really cool. Thing is working fine, I
don't know if I have memory protection on. I am running it from
the desktop. How do I run it instead of the Newdesk I do not
know. I go and kill Newdesk then run thing but it's running as
a program and not a shell.
BTW, I got my english copy of Freedom at Hensa.

David White (davidw@rd.bbc.co.uk) wrote:

Date: 1995-11-12 00:00:00 UTC
From: gregor@shelly.goldengate.net
Message-ID: <bb7cb$132328.3b0@goldengate>
Source record: 156374

I need any suggestions anyone has on some of the problems that
I've been experiencing with FZDT. I finally located and installed
2.20 today and am still having a couple of problems with it.

1. When I ftp to a site (in this case barenone.citi.umich.edu) and start
wading through the directories, the program keeps crashing when I
enter a dir with a large number of listings. the crash is unrecoverable
and I have drop carrier and hard boot to get the program to work again.
2. I experience the same problems when trying to use the ascii send.
crash and the text resets itself to black on black unless I turn off the
system! Anyone else have this problem?

I used to use Teddy term with no problems and might have to return to it.
I prefer FZDT with it's scrollback and text editor, though. Is there
maybe a better term that incorporates these features?

1900. Towers II?

It means that when you reply to them, *you* will be automatically given
an anonymous id too so they won't know who you are unless you tell them.

It basically means it goes though the finnish Penet service which forwards anonymous messages. However this particular user is actualy not using the @anon.penet.fi service, but is faking the address. Therefore it is useless answering as penet.fi is not involved with this user. In fact, this user can't be traced so unless the newsgroup servers agree to run a filter so that messages with the obvious keywords are bounced, I'm afraid we're going to have to live with him (definately a Him).

Preemptive multi-tasking. (>1)-button mice. Menu bars that are attached to
the application window (ie. no more "I double clicked on
<instert application name here> and it didn't do anything!" complaints from
people who are too stupid to notice that the application menu icon has
changed to the <insert application name here> icon), so you **KNOW** when an
application is open. Better games. Object Desktop. :)

Please, if you really *must* respond to one of these phone sex spams,
be sure you do not include the phone number. Blank it out, like I did
above. The whole reason these jerks are posting is to put these phone
numbers in the faces of as many people as possible, and when you repost
the numbers, no matter how clever your repartee, you are only helping
them out. In addition, various net gurus have written programs which
automatically detect (by distribution, not content) and cancel certain
kinds of abusive posts, and when you repost these articles you are
defeating these programs.

1910. A Fully Loaded Atari Mega 2 ST for sale with 50+ original software

Newsgroup: comp.sys.atari.st
Date: 1995-11-12 00:00:00 UTC
From: schiu@crl.com
Message-ID: <486qlc$h0b@crl11.crl.com>
Source record: 156385
Cross-posted to: comp.sys.atari.st,alt.atari,comp.sys.atari.advocacy

My ATARI MEGA2 ST
How much can I sell it for?

Mail me an offer and we can see if we can work something out.
If I get a lot of offers, highest price takes it...OR...if you live close
by, you also get higher priority as well as trades.

Of course, I am willing to trade for other stuff like toys I collect or
anime items, etc...
Stuff like Voltron, Macross, Gundam, Visionaries, any old japanese toys, etc..

If this is the wrong group for this, then please point me to the correct one.
I don't believe there is an atari.st.marketplace.

Here's the run down:

Hardware:

Atari Mega ST2 Comes with Internal Floppy drive and mouse and keyboard
Atari SC1224 Monitor (color, old model, made in Japan the "better" one before
they started using the cheap parts one from Malaysia or something...)
Atari SF314 Floppy drive External
2 EPYX 500XJ Joysticks (very tough, uses a STEEL shaft)
All cables...

Software: (all are originals with docs and box unless otherwise noted)
(Condition of box and docs are usually Excellent too)
(a * means I have actually loaded this and made sure it
works)

1 Hex Mark of the Unicorn *
2 Death Sword EPYX *
3 Starglider EPYX *
4 Questron II SSI *
5 Demon's Winter SSI *
6 Final Assault EPYX

Check the cable. Check the cable. Check the Cable.
I have 4 bad SCSI2 cables and one good
one <the one i'm using>:). Sometimes a bad cable will
work, then with a slight repositioning, nothing. I have
read about bad SCSI controllers, but I have THRASHED my
machine with many different mods (read many mhz's) and
have yet to screw up the Logic chip.

Mike.

1914. need TOS 2.06 help

Newsgroup: comp.sys.atari.st
Date: 1995-11-12 00:00:00 UTC
From: eretic@tiac.net
Message-ID: <484m6f$f2t@sundog.tiac.net>
Source record: 156389

Ok, I know it's a major controversy, but I want to get STonX up and running
I now own Gemulator with the TOS 2.05 and 1.0 ROMs, I'd like a little
PC code to dump the roms to an image file, or a patch to the Stonx
emulator to read the card directly, I don't care which.

Maybe that would be the solutin to this whole controversy, for the
author of Stons to modify his code to only work with the Gemulator card
for those that habe the card already, and want to switch to the linux OS

I don't know. I did manage to get 2 files from an Atari computer dealer
I'm good friends with, but they are labeled 206ODD and 206EVEN,

but STonX want it in one file.

I guess I have legal rights to TOS 2.06 now, that I own the chips, so
please don't flame me.

Eric

Yep, Kobold usually solves such easy problems.
However, there is a demoversion of Kobold 3 available, which could solve
the problem without any cost. The demo is only restricted to 3mb file
operations at a time and no save cfg.

It's been a long time since I mucked about with SAM on my Falcon, so today I reinstalled it. Now when I select SAM Setup from the accessory list, I get the following error:

AES ERROR
Application: SAMCNFIG
Function id: 104
Wrong Call!

And I get an OK button. If I press the OK button, SAM still seems to run happily. When I boot, it gives me the welcome message, and it seems that I can do all the functions I am supposed to do. So what is this error, and should I worry?

: better than the Zip drives?? xtra disks are around $20.00 depending where you
: buy them..

Yes, a friend of mine bought one when I was visiting him in the U.S. The
EZ135 drive is a much better choice, you should go for that drive instead
of the ZIP drive. It's much faster and the disks is cheaper and can hold
more data than the ZIP drive.

It also seems like the troubles that the older Squest drives had are
gone, the new drive is very quite and much quicker to spin up/down when
changing disks. Got for it, it's a very good buy! Besides the drive you
will get a disk, a SCSI termination "connector", a power supply adapter,
and all cables needed for connecting it and get it up and running.
We tried it with both ICD Pro and SCSI Tools drivers and it worked
perfectly well! Go for it!

Hi Mark,

I have the Tower II game for my Falcon, and I have also bought the manual
to it. I think it's a very good game, the graphics are good and the
playability is great (at least that's what I think).

It will probably be even better on the Jaguar, better graphics and sound
and much faster. It's definitily worth checking out!

Hmmm..... I too have had the dreaded undeletable folder/file. There are only
2 ways that i know of to cure the problem. Get KOBOLD to delete it or
if you dont have it, ZERO the partition. EDGE sometimes wont work doing
this but ICD/SUPRA/? utilities will work ok.

Bradly Maurer (gregor@shelly.goldengate.net) wrote:
: I've been using STZip 2.6 for a similar purpose and have had had no
: problem with it. Maybe the problem is not with STZip but with your
: QWK program. When I first started to dl QWK packets, I had a similar
: problem. at that time I believe that I was using a program called(?)
: ST Quick. I could dl the packet reply to my heart's content, but when I
: attempted to ul the packets to a bbs *their* SW could not decode the
: .rep with out some fancy file editing by the sysop. I switched over
: to Mountain 2.6 and this elliminated the incompatibility problems,
: which stemmed from the differences between the st version of the rep
: and the Bluewave versions that seem to be popular these days.
: a question...You aren't using ST Zip on the rep packets are you?
: This is not necessary! Only the QWK dl is archived.
: Mountain is shareware and supports both qwk/rep formats. It is a great
: program and very easy to use. I recomend it... I found it on GEnie but
: it must be available elsewhere.

I tried demo versions of Mountain 2.4 and 2.8 as well as a demo of MT QWK. Mountain 2.4 and ST ZIP worked perfectly, when the BBS was using PKZIP/PKUNZIP 1.10 to process files. With the 2.04g being used now, neither version of Mountain nor MT QWK with ST ZIP worked. Mountain 2.4 (as well as MT QWK) brought up the "not ZIP implode format" error, and Mountain 2.8 with T ZIP produced a "bad CRC" error. To the best of my knowledge, ST ZIP must be creating the .REP file which should be in ZIP format.

For sale:

Atari 520 STFM with 1 meg
Atari SM124 monitor

Asking $100 plus shipping. Comes with software. The monitor's picture does roll for about 2-3 minutes after you turn it on (until it warms up) but it does stabilize after that. In Kansas City, MO area, so if your in that area could arrange a pickup.

And that SoftWindows was a 286 emulation running at slowish 486 speeds.
I beleice this is either fixed - or about to be now.

> DOS emulation, a seperate 486 card! Man I love the PowerMacs, they

The extra 486 was a good short term marketing ploy by Apple - but I agree
- the 'on the fly x86' emualtion needs serious work - as it the obvious way
to go.

> But even if PPC does become the standard, I'm sure Microsoft will want
> only one OS to run on it...THEIRS!!
>
> But it can't last forever...

There is been a lot of talk in the (UK) press about Mr Gates recently. I'm
begining to wonder if maybe MS will take over the software market. I mean
- what can really stop them? The're even trying to push UNIX off
minicomputers with NT. They have effectively destroyed the desktop UNIX
market. A few hundred thousand Linux and BSD users don't really count.

Hopefully though people will get fed up with MS 'one shop world' mentality
and start looking at other people's products.

:-)

Roland.

There's usually plenty of new stuff on ftp.uni-kl.de, as long as you are
after Falcon demos. That's just about all that ever appears on there. I
usually gopher to atari-archive which is pretty quick (no-one uses Gopher
these days :) or Gopher/HTTP to micros.hensa.ac.uk. Both are good atari
sites, updated frequently, and I can always connect to them without fail
(as long as they're online, which is pretty much always, except Hensa
doesn't allow foreign connections from 8am to 8pm, which doesn't worry
me, as we're 12 hours ahead of them :)

|>any windows environment, but at least with a pc, I can actually exit out of
|>windows and have a command prompt to get some real work done.

And what real work is this that's so much better from a command line?
writing code amd makefiles? *so* much faster with CodeWarrior IDE and it's
projects which keep track of everything for you. Also quite nice to see all
the messages from the compiler at the same time as your source, or indeed all
your source files. Remote log-ins? why not have a telnet window so you can
cut and paste, or have several sessions. Editing text? with BBEdit I have
dozens of tools available modelessly from the menubar. Numerical work, say
```

in MATLAB? again, the same applies.

ok, on a system like VMS a command line is probably better, purely because no developer can anticipate everything so the GUI can't do everything. But for getting any "real work" done, a decent GUI (training wheels? what??!?) is a must.

And if you're that desperate, macs have MacDOS, MacShell and nShell for you to play with....not to mention MPW.....

Not if you send from a non-existant place.. of course that would utterly
destroy their systems ability to properly answer mail as it would be
recieving TONS of bounces..

>be appreciated. they don't need to put it in here.

Alas, it will not. This junk typically gets posted to *every* group the person can find. Also, it is frequently forged so that it appears to be from some innocent person the poster is trying to get net.folks mad at.

Correct response is to:
1) send a note giving the article number, newsgroup you saw it on, and your complaint to the sys-admin of the site it appears to come from. Usually, this is postmaster@site, where the "site" is taken from the apparent email address of the poster. At this point, in the interest of protecting the occasional innocent victim of forged SPAMs, I'd lean towards *not* cc-ing it to the poster's apparent email address. Do as your conscience prompts you, in that regard, but bear in mind that often several hundred others will be doing the same.

2) If you're pretty sure it's a posted-everywhere SPAM, post a copy of the article's *headers* (not the whole thing, unless the headers aren't enough to clearly identify it) to news.admin.net-abuse.misc, with a note to the effect that it seems to be a SPAM. Someone will do something about (if it is a SPAM-- sometimes off-topic junk hits only a very few groups, and we just have to snarl and bear it) within a few hours, and unless your site rejects SPAM cancels, the original article (or hundreds of copies thereof, as the case may be) will vanish.

Note: unfortunately, there's nothing we can do, at present, about the followup threads generated by this junk. In this case, I'm crossposting to n.a.n-a.m, to get comments on my recommendations (mostly about whether to cc the apparent poster), and setting followups *only* to n.a.n-a.m, in hopes this thread will vanish from the comp.* groups. Please? :-)

|> Someone did say you can run any game except for copy protected ones on
|> Gemulator 95, but this cannot be confirmed at this time.

I could run Sentinel on STonX (after correcting a little bug in the 68k emulator and after removing the disk protection scheme...); the mouse does not work since the IKBD is used to get absolute mouse position. I could also run Frontier (though I did not try to use the game; I just can say I saw the ship and the dome).

In its current state STonX can run the games that don't:
- make FDC direct access (protections for instance);
- change the default working of the IKBD.
The problem of the IKBD could be worked out but I seriously doubt one could write a perfect FDC emulator since the different computers don't access their drives the same way (I seriously doubt you can portably read a whole track...).

```
Portlink ST - Program for file transfer between Portfolio and Atari ST
""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""

Since the sales have been low I now release it into the public domain!

To companies that sell other products for communication Portfolio-ST:
this is not a rip-off, but a result of hard work and lots of research
with the help of other Atari ST developers both in Norway and Germany.

The ST software communicates with the build-in Portfolio file-transfer-
program and use the Portfolio parallel-interface and Portfolio-PC cable

The cable needs some modifications, but no one should have any problems
The communication speed is much faster than with a PC - And it's free !

Binaries & documentation at: ftp.oslonett.no/user/larserik/portlink.zip
or at ABK-BBS in Norway: Call +4767132659 and get the file PORTLINK.ZIP

Source-code is available on request, send email to adress in signature.

The ST should automatically format MS-DOS compatible disks. However
I have heard of a few problems. If it doesn't then perhaps
a visit to the umich FTP archive might be in order.

Hi Rod,

I have an old Atari ST520...and it does not format MSDOS disks.
There is a utility called st2dos that runs on
he MSDOS machine and allows the MSDOS computer
to read and write to Atari disks. However,
while I have managed to read Atari disks on the
MSDOS machine this way, the disks then seem
to be unreadable on the Atari after they
have be MSDOSsed.

I've seen a description of another program that promises
to do this but can find a copy. Its called Ataridsk.zip
but all of the archives I've tried fail to deliver the thing.

Hello,

I am probably soon going to buy the new HP-LaserJet 5L printer, and I was wondering if there are anyone who knows if there is any existing printer driver for this printer. I do have NVDI and the driver for HP-LaserJet 4L, is this one going to work? The new model has support for 600x600dpi, is it easy to modify the old 4L driver to support this?

I would appreciate all information I can get about this! Thank you!

Hi, Soler!
On a MS-DOS PC, "VGACOPY" (best is Version 6) is a fine Shareware-
Program that can read in almost any Disk-Format (including all Atari-
formats, also executable boot-sectors!). You can easily save images
of a disk onto the PC's Harddisk and even add a comment to the image
file. After reading in all your Disks, you could transfer the images
onto CD-ROM if you've got access to a CD-ROM-Writer.
It would be no problem to reload the images from CD with VGACOPY and
to reproduce the atari-disks (including autoboot disks).

But remember:
When writing images of your disks onto CD-ROM, you wont have a chance
to get direct access to the files! You will always have to load the
image from CD-ROM and to re-create the atari-disk with VGACOPY __on
the PC!!!!____ There will of course also be no chance of accessing
the files in the images directly from your atari (via an atari-CD-
Drive) as they are not stored as FILES but as a packed archives of
the disk-__tracks__!! And do you really have that many atari-disks?
You can store more than 1.000 Doublesided-Atari-Disks on a single
CD-ROM....

But if that is what you want, you will be fine with VGACOPY!
Oops, and don't forget: VGACOPY will only run on a 386 or higher with
VGA-Grafix and at least 2 MB of RAM (recommended are 4 MB).
You should be able to get VGACOPY via FTP from PC-Sites or you can
order it directly from the author (T. Moenkemeyer). I've got his
address somewehere at home, so if you need it, I can send you a mail.

Greetings, Nils :-)

1952. Re: Where's Atari World

Newsgroup: comp.sys.atari.st
Date: 1995-11-13 00:00:00 UTC
From: gio@wcl-rs.bham.ac.uk
Message-ID: <487bki$r5@sun4.bham.ac.uk>
Source record: 156307

Once upon a time... Steve Taylor wrote:
: In article <47v700$t7r@sun4.bham.ac.uk>
: gio@wcl-rs.bham.ac.uk (Giovanni Ciampa) said:-
: >So what... To be honest I'd rather see my money go directly to keeping a
: >magazine going rather than filling the pockets of W.H. Smith et al.

: Yes I agree - I have no sympathies with WH Smith and the others. The
: newsagents I was talking about were the struggling local independant
: newsies who I do my best to support.

Fair point I suppose, but none of the local newsagents near me have ever regularly stocked any Atari magazines, just shelf after shelf after shelf of PC mags - is it me, or are there more and more new PC mags every month, all of which are exactly the same, bar the name, all called (just to be original) PC Something-or-other? Just how many _are_ there, and why is it that half of them seem (to me anyway) to be published by Future?

Though to be fair, I did find my first ever copy of ST Review in a local newsagent, which promptly stopped stocking it (roughly 6 months before it was killed off, ooops, incorporated into ST Format)

: The point I was making is, if you subscribe directly, and therefore
: deny local traders their cut, don't go whinging when they stop
: stocking the mag.

I wasn't. I had enough trouble finding the first Atari World as it was, so as soon as I found it I subscribed, just to ensure that I got a copy. You'd think that in Birmingham there'd be more than a couple of places to find a magazine. To Smith's credit though, when I did find Atari World, it wasn't just hidden in a corner, but had pride of place in the "New Magazines" area.

Be seeing you...

Source record: 156309

To all of you,

As a regular user of Spectre GCR 3.0 on a Mega STe4 I wanted to replace System 6.05 by System 7.1. I managed to copy the basic system files of System 7.1 of the original Mac disk called Disk Tools to my harddisk. When I tried to start the system from the harddisk I got an error message saying the amount of memory available is too less and the startup procedure interrupted. I checked the installation of Spectre and found out I had 3840 kB of RAM space, which should even be enough to run System 7.5. (I actually use this on a real Mac.)
I tried to fixed this by starting up with a System 6.05 disk in station A and using the desk assecoire Heap Size, but this didn't work and I think this is not the right direction to solve the problem.

Can someone help me please? Any useful help would be appreciated.

Thanks in advance,

Peter G.G. Moors

Hmmm... Emulations are emulations; I doubt anyone can build a _really_
useful emulation, capable of running the newest PC games, some of the
most complex application software for Win 95, etc... Without problems.
Few people want to have a crashing Windows 95 on their Power-Macs, or
other non-Intel machines, I think..

: > But even if PPC does become the standard, I'm sure Microsoft will want
: > only one OS to run on it...THEIRS!!
: >
: > But it can't last forever...

What makes me angry is that it's US who feed MS by buying their products!
Gates would _not_ act like a king of the world, if people really rioted
against MS. Refused to buy that over-sized, buggy stuff. But no: it's
like magic (not MacMagiC ;-) . Everybody wants a REAL computer with
REAL OS and REAL software... And everybody thinks: "PC is the only
choice. Microsoft is the only choice."

This has little to do with intelligence, I think. It's some kind of
mass hystery. Nobody stops to think individuallu; people just follow
the mainstream, no matter how silly that might be.
I think, NOBODY will stop Gates, unless people who buy computers
finally wake up - and switch on their brains. I doubt they will =(..

: There is been a lot of talk in the (UK) press about Mr Gates recently. I'm
: begining to wonder if maybe MS will take over the software market. I mean
: - what can really stop them? The're even trying to push UNIX off
: minicomputers with NT. They have effectively destroyed the desktop UNIX
: market. A few hundred thousand Linux and BSD users don't really count.
:
: Hopefully though people will get fed up with MS 'one shop world' mentality
: and start looking at other people's products.

It seems, people will get exactly what they deserve: what you want is
what you get!

Let's just hope we "others" won't have to suffer too much for them.

: do-it-yourself Falcon upgrade file. If anyone knows about this, please
: tell me.

I have one. Here are some experiences:

The memory expansion especially is great! 2..32 MB of TT-RAM
- and this new memory really is _fast_!

Blow-Up screen enhancer is good, too - although the driver software
could be a little better (it should protect the older 38 kHz MS
monitors against too high frequencies - now it's a bit too easy to
destroy your multisync monitor by accident..).

The hard part of FX is the accelerator. It's nasty, if not very difficult,
to install - and the differencies between Falcons make it hard to get
the acceleration work perfectly. My own bird flies fine using 20 MHz
bus speed, 20 MHz CPU clock, and 50 MHz DSP-speed. Unfortunately, CPU
clock doubling doesn't yet work in my Falcon. There is hope; the author
of FX is very helpful, new software updates may improve compatibility,
and there are some hardware modifications one can try.

Even in 20 MHz, FX-Falcon is FAST! Various speed tests show different
figures, depending on what is measured and how. But in practice, FX-Falcon
feels like a TT; in 16 color mode even faster. Yes, I use 816x608x256
screen mode 67 hz non-interlaced (monitor: Salora 14" multisync) - and
programs like Calamus work wonderfully. In 256 color mode, the screen
updates remain a little lazy, but not too much that. In 16 color mode,
my Falcon subjectively feels _a lot_ faster than e.g. the 68040 Mac
Quadra 700s I use at university! 50 MHz DSP makes all kinds of JPG-
decoders and programs like Apex Media, fly! Multitasking with Geneva
works fine, too. I recommend THING 1.0 desktop with Geneva; these two
seem to co-operate great.

My only complaints this far address the driver software (it's still
under developement, so I don't want to criticize it too much). I
personally would like to have a hardware switch (for games ;-) for
speeder-part, or at least an auto-folder program for speed-settings.
The current CPX-module causes some problems, at least with programs
that dislike X-Control panel.

AND.... Could BACKWARDS support FX for faster games 8-) ???
Formula One G.P. in 40 MHz..... Wow!

But even after the slight criticisms, I can recommend FX for most
Falcon-owners. The results are wonderful; it's a different computer

from that moment!

Good work, Blow-Up!!!

Greetings,
Tommi

1958. Mountain Software drops GEnie Support

Newsgroup: comp.sys.atari.st

Mountain Software drops GEnie Support
By Anthony Watson - November 11, 1995

It is with deep regret that as of November 18, 1995 I will be dropping my GEnie account and will no longer be providing product support on GEnie.

I originally joined GEnie in June 1992, and have been a member since that time. In recent months, I have avoided downloading files from GEnie (I can get them faster and cheaper from the Internet), and the feedback I've received here on GEnie has been falling steadily. Because of these reasons, the 2400 baud limitation I am forced to use, and the fact that GEnie is costing me more than it is earning, I have decided to cancel my GEnie account.

I would like to stress that Mountain Software will continue to provide product support via the following locations:

Internet E-mail: awatson@pacifier.com
World Wide Web: http://www.pacifier.com/~awatson
FTP: ftp.pacifier.com/pub/users/awatson
Bear Cavern BBS: (360) 573-2054 [E-mail to Anthony Watson]
FIDO net: Atari ST conference. [Message to Anthony Watson]

I regret any inconveniences this may cause...

Anthony Watson

1959. OASIS mail error 026

Newsgroup: comp.sys.atari.st
Date: 1995-11-13 00:00:00 UTC
From: andrew@ajrose.demon.co.uk
Message-ID: <816284232_OASIS_@ajrose.demon.co.uk>
Source record: 156314

As of last log-on to the net I've been unable to access my e-mails on OASIS - the program is crashing during the "Indexing New Mail" process. First I get Error 026 (whatever that implies), then another error message, then a total crash. The mail is definitely there - I can read the file from the desktop, but cannot access from within OASIS. Any clues, or do I have to scrap all my email files and start again (not my favoured option :-( )

Andrew

PS. Further inverstigations, running Oasis under the more stable Magic OS, allow me to post up the second error report:
Program returned:
TOS Error
(Error #-230)

Hope this will allow someone to stab at 1) a diagnosis, 2) a solution

It takes a little while. (A minute or two seems like for ever when he is
throwing fire balls at you.) When he starts getting fuzy around the edges you
are real close to having him. Wear you best stuff. Use fire shield
spells. Dodge his fire balls when you can. Let him have it with that fire
staff.

Why licence when you are one of the best programmers on the ST scene? Don't have a go at them until you've seen them-or have you? Also why not let te population choose what they want to use? Maybe I want to use Ease & Selectric and would object to having to pay for 2 licenced programs that I would never use.

What's the difference between the mic input on my Falcon, and the line in on my PC's SB16? I tried to connect the audio out of my VCR to the Falcons mic in, hopefully to capture some sounds, and it's really bad. I plugged the jack into the SB16 line in, and the sound is more what I would have expected. There is also a mic in on the SB16.

The Falcon line in on the original Atari machines cannot handle any
significant signal levels. Basically it's quality isn't too good to
start with but when you connect any LINE signals it gets worse. I think
you can rectify the problem by building a small circuit which reduces
the power levels.

Fro what I gather the new C-Lab machines have better quality mic sockets,
but I'm unsure if they include line in/out.

Hi there,
My TV-set is about 10 meters away from my computer, so it's really a pain to connect it. Besides, if VGA systems don't support all extra graphic goodies it should be seen as more of a challenge to make things work on both systems, don't you think so?

> And then pointing out all demo competitions today only requires RGB
> operation. Why then make a demo which works on VGA, which could be
> better as RGB only, and have less chance to gain a good position in the
> voting?

See my previous comment about the challenge...
If all competitions work this way today, I think they should change the rules and give extra points to the programmers that are able to make their stuff work on all Falcons and this should contribute to a clear advantage, because they're simply better programmers...

> I do however agree that commercial games should work on both monitor
> styles. Since you then have to purchase money for them. And if a demo
> should work on VGA, great for the VGA owners, sad for RGB owners (they
> get a less impressive product).

Everything should work on BOTH RGB and VGA in my eyes - I can't see any logic in excluding anyone from seeing your impressive programming work.
I get very frustrated sometimes when trying to view demos and everytime I've thought "idiots that can't make it work on VGA". Since there apparently are differences in programming on the systems (which I didn't know before), I guess I'll have to think a little less condemning from now on, but I still wish all programmers would want ALL Falcon owners to be able to see the impressive work they've done.

Best regards,

Claes

Source record: 156329

Hello everyone!

Do you want to make your own CD?

I've just had some more info about SoundPool's CD-writer software.
There are two versions available; "CD-recorder Pro", that writes both audio and
data CD's, and "CD-recorder Audio", that only writes audio. There is
the possibility for PQ editing.
Supported drives for the moment are Ricoh, Philips and JVC.
The price for the driver software will be: (here in Sweden)
CD-recorder Pro SKR2700 (approximately USD385)
CD-recorder Audio SKR1400 (approximately USD200)

If you can't find it elsewhere, closer to you (try the stores that carry other
SoundPool products), I work at a company here in Sweden that deals with most
soft- and hardware for the Falcon, so I can forward an order to our ordering
department - write a mail to me and I'll find out the exact cost and terms of
payment.

Best regards,

Claes

>Does anybody know about any program to read Atari-ST disks on PC and
>make an image file of them?

Easy. Save your images as GIFs (You will need a PD converter if you dont already have one. Format a disk on the PC, and copy your GIF files on to it using the desktop on your Atari. Stick the disk in to the PC and almost any art package can load them. If you want you can then copy the files on to the PCs hard drive.

I have an Atari Portfolio for sale, standard configuration with
German keyboard and German manual, 64 kb RAM card and parallel interface
with data transfer software to PC and Atari (FolioTalk) included.

The Atari
software actually allows one to browse in the Portflio directories in windows
and to transfer files with a mouse click. The Portfolio software includes
a special cable.

150 $ or bo. We share shipping.

John Hutchinson (jhutchin@ist.ucf.edu) wrote:

: Fair enough, Joel. But what, in your mind, distinguishes a DEALER
: from a DISTRIBUTOR if not _volume_? I'm not privy to the exact

A dealer services the people, distributors service dealers. They have
one purpose, to provide a common location for dealers to order from.
This saves dealers on cod tags, shipping, and phone calls.
Distributors sell at about
5 to 7 points above cost, dealers margins are more like 20 points....

if toad were to sell to other dealers at prices that would let them compete
with toad, that would be a different story.
: deals that Toad was able to wrangle out of Atari on hardware but
: I would imagine that every dealer had the same opportunity, IF

Yes, I believe that they should get a discount for ordering in bulk,
but if they
get a 'special' price, special enough to allow them to sell it for less than
any other dealer can get it for, let alone what a distributor can get it for
more power to them. That means that that developer will then only sell to
Toad. No one else can afford to(loose money) compete with that.

: they could come up with the necessary funds for a bulk purchase.
: It's the same situation as discount store chains... they can sell

When the STe's first came out, Toad was selling them cheaper than my dealer
could get them for, that's Atari's Fault.
Atari was key in the demise of my dealer...

Are there Wal-Mart stores where you are? Are there family owned auto
parts stores? What Wal-mart lacks is the service these smaller stores have
Sure, they can sell you oil and spark plugs but I is there someone there to
make sure you are buying the right thing? dd

It is not possible for Toad to service the Entire hemisphere.

Service is not solely shipping defective merchandise back and replacing it,
service is partially knowing the customer which is not real feasible
with only
an 800 number.

If they opened a storefront everywhere they put a dealer out of business,
that would be a TOADally different story.

: for less because they purchase in quantity deals. Atari, as ever,
: was only interested in the short-term bucks, not the long-term
: effects of such dealer/distributor policies.

Atari is not a company, it's a Tramiel Tax Shelter.

: As an Atari software developer for several years, I can only point

For this I congratulate you, After being employed for the last ten years by a company that has developed solely for the TOS platform, I know the anguish that is involved.

: to Atari HQ for the current state of the market today and, conversely,
: to Toad and other hangers-on for allowing what market we have to
: continue as long as it has.

Atari is not a company, it's a Children of Jack Tramiel Baby sitting service I think it's still around to keep Jacks kids from playing out of HIS money.

: For a "dead" computer, there's a lot of life out there. :)

You must be confusing me with someone else I don't believe I ever used the word 'dead' in relation to the Atari platform, execpt maybe as a PCers viewpoin t.

I just bought 2 TT clones, and just had two new cds pressed.
I don't plan on leaving any time soon.

BTW, you probabally don't remember, but I think we met about 3 years ago at the KC 'show' ....

BM> You aren't using ST Zip on the rep packets are you? This is
BM> not necessary! Only the QWK dl is archived.

This might be misleading to some. Mountain Reader (and probably all others) archive the replies, while still inside the program, to make the packet - by calling an archiver (stzip in my case.) So it is not workable to archive the rep packet; this is because it is already archived.

BM> Mountain is shareware and supports both qwk/rep formats. It is
BM> a great program and very easy to use.

Mountain is not really shareware - it is commercial. The one you have (unless it is pirated) is a demo, only needs a key to be fully functional. There are one or more cracked keys around. Don't use 'em! Pay Mountain Software for the most recent version 2.9. $25 Christmas special - well worth the dough, and a great, useable, program. And lots of goodies are on the disk. (I am not doing commercials - I am just a satisfied user.)

Sorry, but you're out of luck. Gemulator 95 is supposed to support the
MIDI ports on the sound card, but it's a feature that "will" be added to
registered owners in the future. Accoriding to Darek, it's a
low-pryority because most MIDI applications are copy-protected. It's all
on the Branch Away web page. I'll end it right here.

I know that Freedom and Thing support the longfile names for the Minux
partitions, can something be adapted for the Win95 longname format?

Gee, I wonder how all of this affects Gemulator 95 where you run Win95
and TOS at the same time. :)

Could you post the following message to all comp.sys.atari.*.* groups if
you havn't seen it there (I'm not sure my posting get through....) ?

Portlink ST - Program for file transfer between Portfolio and Atari ST
""

Since the sales have been low I now release it into the public domain!

To companies that sell other products for communication Portfolio-ST:
this is not a rip-off, but a result of hard work and lots of research
with the help of other Atari ST developers both in Norway and Germany.

The ST software communicates with the build-in Portfolio file-transfer-
program and use the Portfolio parallel-interface and Portfolio-PC cable

The cable needs some modifications, but no one should have any problems
The communication speed is much faster than with a PC - And it's free !

Binaries & documentation at: ftp.oslonett.no/user/larserik/portlink.zip
or at ABK-BBS in Norway: Call +4767132659 and get the file PORTLINK.ZIP

Source-code is available on request, send email to adress in signature.

>this a bug, or something to do with the protocols it uses?

Hmmm... i can not verify this, as i do only have small 1040STE...

Question: Thing starts programs using some special shel_write()-modes
to pass local environments. But the buffer for these local environments
is just allocated using Malloc() and not Mxalloc(). Should i better
use Mxalloc()? Does AES not create a local copy for the launched
application, so it can access this environment without problems? I
did not find any hint in any documentation...

Ciao... Arno

,
RA> M_Print10

The printing part of MasterBrowse

RA> and Shdwterm 11.

Terminal program.

RA> I can't figure out how to put all of this stuff together

These are all independent programs written (except for ST Guide) by
the author of esscode. They have nothing to do with esscode except
common authorship. So you don't put them together.

RA> so it will uncode some files I have
RA> saved on the Freenet and to disk. I would appreciate all the
RA> help I can get and feel like a total retard! thank you very
RA> much in advance. Ron L.

Didn't Michel Forget (author) include some .doc files to explain
what all this stuff is about? At any rate, all you need is esscode
for decoding files. You may need to de-archive files also, using
lzh, stzip, or arc.ttp, or whatever, but esscode is just for
UUEncode/decode, and btoa, mime, and ?? files. Esscode *might* have
a .hyp file as part of it, in which case you *might* choose to load
st guide as an accessory, in which case you will have on-line help.
But it is not necessary (and I don't remember whether esscode has a
.hyp file or not). Esscode is moronically simple to use - it doesn't

really need online help.

All the above was done from memory - in case of mistakes, direct flames to Bill Gates (hey, why not?)

EP> be in ZIP format.

That is correct; Mountain Reader (and MicroTalk, IIRC) call whatever archiver you set in your preferences.

I asked the sysop of our local BBS about this tonight, since I had the same problem until he fixed it. According to him, it *was* pkzip 2.04g that was causing the problem. And not only with my messages - it died no matter who tried to send zipped .rep packets. He put pkzip 1.2(?) back to work, and everybody is happy, including the pc users who use his board. Sounds like pkzip2.04g will be moving up to v2.05a soon, n'est pas?

not if you set the reply address to their address then the mail bounces in
limbo until the mailbox is cleared out.

Now that is a mail bomb!

That is also an invitation for frame-up artists to use you to harm an innocent bystander. There have been quite a few forged net-SPAMs whose sole purpose was to get an innocent person's mailbox bombed, and thanks in part to people who aren't competent to verify a post's authenticity but nonetheless insist on mailbombing the "poster", it usually works.

Never set up a mailbomb until you are absolutely certain the person at the other end was in fact responsible for the objectionable post, and not merely an innocent victim of a frame-up. Mailbombs in general are a serious breach of netiquette, but mail-bombing a completely innocent bystander is much, much worse than what it is you *think* they are to blame for.

If you see a SPAM, report it to news.admin.net-abuse.misc, with full headers for the article in question, and possibly to the postmaster at the site that appears to have originated the post. *DO NOT* mailbomb the person who appears to have posted it; that person is quite frequently the innocent victim of a SPAM-poster out for revenge or just coldly dodging responsibility.

("SPAM" is a generic term for massively-posted or cross-posted articles; for more precise definitions, read any "EMP/ECP cancelled" notice on the group "news.admin.net-abuse.announce").

Sounds unfair. Why PowerMac/486, not Centris 650/Pentium?

Alex.

2005. A Fully Loaded Atari Mega 2 ST for sale *UPDATE*

Newsgroup: comp.sys.atari.st
Date: 1995-11-14 00:00:00 UTC
From: schiu@crl.com
Message-ID: <489jcd$54d@crl5.crl.com>
Source record: 156211
Cross-posted to:
comp.sys.atari,comp.sys.atari.st,alt.atari,comp.sys.atari.advocacy,ba.marketplace.computers,comp.sys.amiga.marketplace

Highest and only offer is 250...

My ATARI MEGA2 ST
How much can I sell it for?

Mail me an offer and we can see if we can work something out.
If I get a lot of offers, highest price takes it...

Of course, I am willing to trade for other stuff like toys I collect or
anime items, etc...
Stuff like Voltron, Macross, Gundam, Visionaries, any old japanese toys, etc..

If this is the wrong group for this, then please point me to the correct one.
I don't believe there is an atari.st.marketplace.

Here's the run down:

Hardware:

Atari Mega ST2 Comes with Internal Floppy drive and mouse and keyboard
Atari SC1224 Monitor (color, old model, made in Japan the "better" one before
they started using the cheap parts one from Malaysia or something...)
Atari SF314 Floppy drive External
2 EPYX 500XJ Joysticks (very tough, uses a STEEL shaft)
All cables...

Software: (all are originals with docs and box unless otherwise noted)
(Condition of box and docs are usually Excellent too)
(a * means I have actually loaded this and made sure it
works)

1 Hex Mark of the Unicorn *
2 Death Sword EPYX *
3 Starglider Rainbird *
4 Questron II SSI *
5 Demon's Winter SSI *
6 Final Assault EPYX
7 Winter Games EPYX *

2006. Boston Area Atari Users...

Newsgroup: comp.sys.atari.st
Date: 1995-11-14 00:00:00 UTC
From: dhbutler@stat.mps.ohio-state.edu
Message-ID: <48arsm$geu@osustat.mps.ohio-state.edu>

This i sonly going to be of interest to Boston area ST/TT/Falcon owners;

I was pleasently surprised to find, about two weeks ago, that my employer (Micro Center) is now carrying ST Format! At this point we are only receiving 5 copies per month, and I am the only person buying one! Anyone interested should stop by and pick up a copy to help ensure that we continue to carry this product. It is a nice glossy rag from Europe with a fair layout and reasonably good articles, plus a cover disk. We also carry a few Amiga magazines if anyone is interested.

BTW, this is not meant to be an advertisement for Micro Center, just an errrr. public service announcement, yeah, that's it...

It is interesting the number of comments my little Atari emblem on my name badge gets. The most common comment goes something like "Wow, Atari, I still have my ST and love it" or "I wish I could still get products for my ST, it was much better than my PC is." I have even been doing some Technical Support for the ST/TT/Falcon line (usually I do Mac Tech Support). Heck, if you have a question about your system stop by and see me - I work in the Tech Support department.

Long live Atari!

: >tos bug that will some times zero the boot sector on a H/D (i have tos 1.02).

If it's just the boot sector you've lost, you can very easily restore it
(takes a good disk monitor and 2-15 minutes depending on your skill).
If you really have lost both FATs of a partition, you can still
restore your data, but it will take a lot of time and effort
(days or weeks!). So the first thing to do is to find out what
parts of the partition has been erased. Is it just one partition
which has been damaged? Get yourself a good disk monitor and look
at the boot sector and FATs of the partition.

If it's just the boot sector, you can copy another boot sector to
the damaged partition and then edit the parameters in there. The
parameters you need to change usually are the following:

- Number of sectors in the partition
- FAT size
- Directory size
- Sector size

(You will need some documentation about the boot sector and FAT
structure. This can be found in lots of books and probably also
in technical documents on ftp servers such as atari.archive.umich.edu.)

After you've fixed the boot sector, you will usually get at the
listing of the root directory again. If the FAT has been damaged,
you will still not be able to retrieve larger files, but most of
the time you will be able to scan through the partition to find
the files you really need to recover. Make a list of the files
and try to fix these and only these to reduce the effort.

The most important rule is: DON'T PANIC. I've seen so many people
format their hard disks in desparation and panic where the data
would have been easily recoverable...

>I plugged the jack into the SB16 line in, and the sound is more what
>I would have expected. There is also a mic in on the SB16.

The line in on Falcon is (smartly) configured to be able to dirve a
condensor microphone like those in headsets.
To be able to do this there is a Power supply Current (9.8 V if i
remember correctly).
In order to get a REAL Line output you need to put some resistors to gett
the right input impedans and some condensators to get rid off that power
supply voltage. The configurations aought to be able from ftp sites as a
picture file (linein.zip or something like that), where you can see how
to connect it..

If the criteria below are fulfilled, I'd have no objections to MGIF
being put on the CD. I hope you have the time to wait for version 5, though,
which should be out in two weeks (I hope). The last public release, v4.2,
is _extremely_ outdated.

>Paul, any PD/sharware author who does not want their program on a CD has
>to be the biggest fool. If you put alot of new PD stuff on your CD, then

It would indeed be surprising if a ShareWare author had any objections.
The usual definition of PublicDomain software is that anyone can do
whatever they want with it, including selling it for profit.

The problem is probably those of us who write FreeWare. We don't ask for
any money for ourselves, but at the same time we reserve all rights to
the software and don't want anyone else to make money out of it.
For CDs which are not supposed to make more than a token profit, most
FreeWare authors would probably not have any objections (me included). I'd
like to be notified, though.
If the CD _is_ made for profit, I (and likely others) would be content if
I got one for free.

2014. Printer drivers for PGS

Newsgroup: comp.sys.atari.st
Date: 1995-11-14 00:00:00 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <48a6l0$27n@cxc1.cl.msu.edu>
Source record: 156220

I'm looking for two specific printer drivers for use with PageStream 2.2b,
please let me know if these are available and where:

Epson Stylus Color
Epson FX-850

Also, I'm curious if anyone has ever found a good printer driver to use
with the Panasonic KX-P1524 wide carriage printer. The manual says it's
an LQ-1500 compatible, but all the LQ drivers I've tried just beep and do
form feeds. PageStream's printer list says to use the EpsonX driver, which
SORTA works but the vertical page size is not accurate (read: SEVERAL
INCHES...)

Thanx!

2017. Q: Accelerator Boards

Newsgroup: comp.sys.atari.st
Date: 1995-11-14 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DI0v0n.FKM@actrix.gen.nz>
Source record: 156223

What accelerator boards are there for an STe that don't require too much electronic expertise to install, and what can I expect to pay?

I see toad has the T28 board, but that's rather on the expensive side (Near enough $350). Or, I can get the ICD-Adspeed STe for about $200 from System Solutions in England, but as the price for their T28 works out to be about $310 for an extra 12Mhz it looks the best option so far. Plus from what I understand the T28 has 64Kb of cache on it.

The PAK boards seem to need a tower-case type arrangement but seem to be a similar price to the T28 (For an 030).

So, anyone out there help me? I've got a standard 1040STe with 4meg RAM in it. I want an accelerator that will preferably about triple the speed of the machine, and if it is compatible with the Spectre-GCR, then that's a bonus as well. Basically, I want lots for little cash :)

Cross-posted to: comp.sys.atari.st,oc.forsale,la.forsale

I've got a load of STuff I'd like to unload. Money would be nice, but
if you offer to come and pick it up, I'd be happy to have the space
back in my office! :-)

Atari 1024 STF with 1Mb
Atari 520 ST with 1Mb(?) (not working)
Supra 10Mb and 20Mb external hard disks.
Atari SM124 monochrome monitor
Atari SC1224 color monitor
Stereo Tek 3-d glasses

Everything works last time I checked (over a year ago), with the
exception of the 520ST.

There are also a couple dozen software packages: games, compilers,
spreadsheets, etc. All over three years old.

Again, a local pick up would be preferred (I don't really want to ship
all this stuff!). I'm in south Orange County, California.

Send mail if you're interested!

2019. Q: Word-Up

Newsgroup: comp.sys.atari.st
Date: 1995-11-14 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DI0v79.G00@actrix.gen.nz>
Source record: 156225

Having a hunt around on the web this morning, I noticed a patch to upgrade WordUp 3. Hmmmm... I wondered, what version have I got in that box. After looking at the disks it turns out to be v2.0, with the manual claiming to have been packaged with v1.0. I take it the company no longer exists!? Anyone know how I might upgrade to v3 without too much cost? (None at all would be nice :)

If I take the upgrade files, then I only need about 2/3 of the other files which have become 5 disks rather than the 3 that v2.0 takes up.

I haven't got the original disks, but do have the original manual complete with it's binder/box. (Sounds strange I know, it was part of the package when I got a _free_ 1040STfm and SM124 monitor + Megafile 30. Pretty good for free stuff I though :).

Is there any point? If so, anyone able to help with ideas or otherwise?

] > out of the box. DSDD formatted for IBM) disk. Take the disk home and
] > it in the drive and voila!
]
] Great, just tell me the name of it and where it's at. I'll do the whol
] campus a favor and put it on every lab Mac here :)
]
] BTW, putting in a DD PC formated does "not" work on a Mac without a
] built-in program that lab managers delete for some reason. And don't
] even tell me about a application that comes with a very expensive set o
] networking programs.
```

The main such utility is "Apple File Exchange". It requires an apple "Super-Drive". (Pretty much any Mac' made since about '92 will have one). This program comes on the system disks.

System 7.5 has the ability to read PC disks built into it. (It may be a system patch, but the 7.5 I've seen could).

On the ST, the only programs that will easilly read a mac disk is the PD "Mac-Read" which is on most archives. Or the commercial version of same, "Mac-SEE" (Which I want, but can't find anyone to tell me how to get it). It will read HFS disks, but obviously not HD disks. It will only READ, NOT WRITE!

Hello everyone,

I have got my web pages into some sort of readable fashion now, so if you have access to a WWW browser then perhaps you would care to have a peek ...

The main development area has been the Atari section which is continually being enhanced.
Anyway it includes info on running Linux on the Falcon aswell as info on the InterActive shareware support scheme run by Joe Connor. This scheme is aimed at UK Atari users to ease the pain of supporting "foreign" shareware programs.

Let me know what you think and if there is anything you would like included or if you think it's total bull ....

The full address is right at the bottom of this message.

Bye for now,

Simon

>recommendations on which TT RAM board to buy, and where to get it from
>(preferably in North America)
>

I just got a 4 meg Atari TT board for pretty cheap from someone on the
net. Let me tell you, it makes a world of difference, espcially with
Linux and X! Once I got most of my TOS/GEM programs to use the TT ram, they
flew much faster than usual for memory intensive operations.

My question is this: I have seen some posts which mention to have your
jumpers set correctly to use burst IO mode. I have three jumpers on my
board, but none of them are set. This is a standard Atari 4 meg Ram board.
How should these jumper locations be set for optimal performance?

Thanks

You could think of installing a cronjob which gets the wanted files by
ftp during unrestricted times. You'll need ncftp for that though...
(and a unix machine)

Rod Keen(Sysop) (ROD@gaiasys.demon.co.uk) wrote:
: One of my sons has asked for the impossible for Christmas...
: A game that has been dicontinued!!! I have checked several dealers and even got
: onto Microprose and they have no stock either so I'm asking here..

THIS IS NOT FAIR IMHO !!!!!):-(

Even if MicroProse decided that they don't want our money (this is the truth;
Colonization, UFO, and some others of their games STILL would make them
money - because they already HAVE Amiga-conversions ready... And conversion
for ST would't therefore be too hard at all!) - THE LEAST THEY COULD DO IS
HAVE THEIR OLDER ST-TITLES AVAILABLE IN SOME FORM !!!!!!!!!!!!!!!!!!!!

They could be packed in (virtually free..) paper bags, or whatever!

Many people WANT e.g. Civilization.... I really wonder, whether those
people at Spectrum Holobyte/MicroProse have any brain at all - or
have some kinds of calculator-heades a**holes taken over the whole
business.

I repeat: this kind of business is *NOT* good business; they themselves
lose money, if not much - and they make their old customers very angry!
I see no acceptable explanation here; this is just greed at its clearest
form. Greed. Well, millions of PC-users hardly care. It's so damn
easy to forget us, minorities, when some other people yell louder.

And those of you who are about to reply: "sorry, pal - business is
business...". Please, shut up. This computer business has become
cold, hard and crazy enough, I think. We don't have to support that
trend any further, do we?

Should we teach MicroProse some habits..? Letters? Maybe...

I'm at least tired of getting treated like this.

: Do you have a copy of CIVILIZATION for the st (full version not the demo) that
: you would be willing to sell to me.
:
: Reply by private e-mail to save bandwidth please with details.

Sorry; this subject just is too important to handle privately ;-) ...

If I could sell you my copy, I would. I just love the game too much;
couldn't ever sell it. Hopefully someone will - if MicroProse doesn't
learn to act like an adult firm should..

:
: TIA

Greetings,
Tommi (an ex. MicroProse customer, supporter, etc - now just angry at them)

2031. 486DXII Board for Falcon?

Newsgroup: comp.sys.atari.st
Date: 1995-11-14 00:00:00 UTC
From: regis <santadog@ns.cencom.net>
Message-ID: <4896d4$f78@news.cencom.net>
Source record: 156237

I haven't been keeping up with new products for a while, but I remember talk about a 486DXII add-on board for the Falcon. Anyone know what, if anything, became of this product? Seems like Compo was developing it... or might have been Wizztronics?

On a somewhat related note, has anyone heard the rumor about a PPC upgrade card for the Amiga? If this is true, it's great to see this caliber of 3rd party support for such a small market. I hope this kind of support can continue with the Atari products.

One final thing...

Having the ability to create custom emulation boards for different platforms (ie, Falcon Speed, GEMulator, MagiCMac, etc, etc.) It strikes me that in the not too distant future, engineers will be able to design a Super Charged PentiumPPC Turbo chip, which would be able to manage all the different OS's in realtime multitasked processing. No doubt, at it's core would be a beating UNIX heart that through AI would "sense" the application(s) you are running and select the best OS to run it from.

Gotta go... looks like my pipe is burning out.

For burst mode link pins 2 & 3 on W105.

For TTRAM start address of $0100 0000 link pins 2 & 3 on W103 & also on W104.

For 4M x 8 SIMMs link pins 1 & 2 on W101, also on 102 & 106.

> disappeared with the home computer is the fun factor we used to have
> of being different than business).

But why would anybody buy it? Where is the market?

True - there is room for games consoles. Some people need a machine capable of playing great games and nothing else. However most other people want a general purpose machine - and this includes being able to take work home from the office. While PCs were expensive and crude - better machine like the ST flourished. However they have been superceeded by PCs which are much more powerful, play great games - and are still techie enough for the computer hobyist.

> Let's imagine a newly updated Atari ST. We have a backlog of carefully
> coded (takes up small space) and well tested programs. Let's put

Bottom line is that people will still want to know if it runs Windows95. If not - it will never be considered a real computer.

> Now add multi-tasking TOS with GEM and you have one speedy, powerful
> and inexpensive home machine which, with internal applications, could

It seems to me that Atari have already made one half hearted attempt to do this with the Falcon. However the basic machine was nothing like powerful enough to pull it off. Not cheap enough either once all the extras had been bought.

> well for on-line stuff. Sell it with a laser printer for under
> $1,000. Do you remember when the original ST came out for under
> $1,000 and the excitement it created?

But that was 85/86. Back in the days when some home computers didn't even have an on/off switch - letalone a decent keyboard and a floppy disk drive. People expected to start their software collections from scratch and had no need to run expensive/boring commercial appliactions. The market isn't like that now. People have much higher expectations - and the Atari software base is IMHO not strong enough to carry this off. The core Atari 680X0 design is no longer sufficient either.

Okay - I'll conceed. It is a good dream - and with a decent PPC or Alpha chip - a consortium of companies could rewrite the future of the home computer market. However it won't be Atari - and it certainly won't be with the aging ST/Falcon design.

:-(

Roland.

Insignia AccessPC, Dayna DOS Mounter, and Apple's Mac/PC Exchange all
do what you describe, but they're all commercial. No wonder they get
deleted. However, PC Exchange comes with System 7.1.2 (Power Macs) and
later (System 7.5).

> Yes, you have to surround him in a flux cage and then invoke the fire staff
> or something like that. Try to catch him in a corner, but be quick.

Ah, yes. I remember this. First of all, you have to find him. In the last room I believe he starts on the left side. You can get to the right, running past the flame pits. There's an empty square at the back of the room, stepping on which ignites the flame pit there. Don't step on it. Go around it, and you can step over the flame pit.

In the little chamber in the rear left, there's the Eye of Time. That may freeze him long enough to nail him.

You have to trap Chaos on four sides, then Fuse him with the Firestaff. Fluxcage is the suggested method, but stone walls work too. When you Fluxcage, you should be right in front of him, so the cage appears around him, not in front of him. [I know the cage appears around him, but you still have to do it on four sides.] Depending on your version of DM, it will crash if you Fluxcage him when he's not facing you.

If you can't get him to stay still, try leading him to the front right corner of the room, where there are two one-square areas surrounded by three walls. Lead him near there, then get on the other side of him (so he's between you and that space. Fuse him, and he'll back up "just in time". When you have him cornered, *Fluxcage* him first! If you Fuse him from his only free side, he'll teleport, and you have to find him again.

The endgame isn't spectacular (not nearly as cool as Ultima VII's), but just for kicks pull out your level one map and try exiting the dungeon with the Firestaff [and no, you can't do it if you got the Power Gem].

Enjoy!

>
>As a supplementary question to get your head around, sometimes when
>unbatching newsgroups, I get a Module Missing report.

This seems to refer to a missing article or perhaps an incomplete
article header (in my experience).

>Pressing return usually allows it to carry on with no apparent
>difficulty, except that I lose the GEM surround box.
>
>I have an empty news item in one group which refuses to be
>acknowledged as read.

Had similar problem myself. The problem only went away after I removed
the group then added it again.

>This is
>a) in the group where Oasis gets stuck when reading;
>b) in the first group it reads.
>One or other of these two points may be pertinent. I'll be expiring
>the mail shortly, and report on the effect of this action, if any.

I've had situations where Oasis has been unbatching and then tried to
go back to a group it has previously visited. It always causes a
crash. I've no cure for this really. Sometimes removing the group
before the one causing the crash can help, sometimes not.

Another problem I've had concerns articles which span one or more
other articles.

All the problems seem to point toward an indexing problem which in
turn points to a problem locating article headers, which doesn't
really say much. Did Oasis cause the problem unbatching - I don't
know. Did NOS cause the problem writing its file - I don't know. Did
the Demon end cause it - unlikely. Were the mangled articles posted
that way - possibly.

<snip>

Sorry I can not be any help, Kathy...

You are not the first to ask this question, I have just lurked on this
one up to now. BUT, lets be honest It just doesn't work , or does it?

In the past the answers given to this question have been: set the path
to a WWWCACHE folder. and/or you must have a cslip connection bad luck! OR
most recently: you must have the OVL file missing.

Now, like you I've got the latest 1.08 version off Hensa, set up the cache
used an amended Demon cfg. The IRC client works fine so Stik is logging
on and connecting fine. Just "Read Error in File etc"
I have changed baud rate, DNS server, used HSmodem6 etc there is Nothing
left to try ... or is there? anyone?

2040. Atari brings back home computer?

Newsgroup: comp.sys.atari.st
Date: 1995-11-14 00:00:00 UTC
From: hellman@teleport.com
Message-ID: <489ao8$msn@maureen.teleport.com>
Source record: 156246

Hello All,
This is in the realm of "any computer company could do this"
but.......
Has anyone noticed that the "home computer" has disappeared from
sight? What you buy for the home is now just what you have at the
office. The Windows operating system is the same for both. What a
waste! Windows is heavily loaded with all kinds of networking code which
is not used in the home at all.
As PC's at the office become more and more networked, using heavy
duty networking applications, it will become more and more unreasonable
to re-create this environment in the home. Sure, some people will log
on to work machines from home, but these are not the majority of "home"
users.
So what is needed is a genuine home computer, dedicated to home
uses, with built-in applications, low cost and a fun factor (what has
also disappeared with the home computer is the fun factor we used to have
of being different than business).
Let's imagine a newly updated Atari ST. We have a backlog of
carefully coded (takes up small space) and well tested programs. Let's
put Pagestream, 1st Word Plus, and some other maintream reliables (your
vote?) in ROM. The palmtops do this to a smaller extent now. Of course
these programs would have to be newly updated to print from common fonts,
share the clipboard etc.
Now add multi-tasking TOS with GEM and you have one speedy,
powerful and inexpensive home machine which, with internal applications,
could take care of most home needs. Can you imagine how this would fly
with the major applications in ROM? Give it enough memory so outside
applications and games could also be loaded, but with the built in stuff,
most home users would have an extremely reliable computer that virtually
no one could foul-up, no matter what they did to their hard drive.
Make sure you have a good CD ROM and decent drive space...could be
ZIP or hard drive. Keep the midi people happy. Make sure it works well
for on-line stuff. Sell it with a laser printer for under $1,000. Do you
remember when the original ST came out for under $1,000 and the excitement
it created?
No, it wouldn't be completely compatible with work computers, but
that's the whole point...this is a *home* computer (but you could build
in RTF and text saves for the occasional text you need to bring in to work).
I can see the Atari ads for this:

Q. "Why is a game company putting out a new computer?"
A. "Because all the big guys took the fun out of home computing and we know
how to put it back!"

Do we?

Organization: Empyrion BBS
Subject: NVDI & FONTS - HELP !!!

Hi,

Call me a moron, but...

I can't get my little head around getting NVDI 2.5 to give me different fonts.

I've downloaded various *.FNT files from some Bulletin Boards and stuck them in the GEMSYS folder on my boot partition, then run the ASSIGN.PRG thingy and plonked their names under the '04p screen.sys' entry in ASSIGN.SYS. (I use hi-res. mono)

BUT... when I reboot, none of my applications will offer me anything other than 'System Font' (e.g. Everest, Ease Desktop etc).

What am I doing wrong ?

Can anyone help a poor deluded idiot ?

(Can I ask for e-mail replies please, my local BBS has just stopped getting usenet groups, thanks.)

Cheers,

Kev.

***** Stuff deleted about home computers *****

There was a small news item in the Sunday Times about the founders of Apple.

It seems that early on (before Apple was founded) they approached Atari with their ideas for a home computer which they had constructed using Atari parts, but Atari sent them packing. (So did HP btw).

Imagine how different things would be today if Atari had produced an ST/MAC type computer in the early '80's. With Atari's low cost manufacturing & an Apple-like GUI, it would have taken the world.

History is full of lost opportunities.

Standard DD floppies formatted on an MSDOS machine should be readable
without problems on an Atari system. If they're not, the possibilities
are:

1) you've got a SS drive but you're trying to read a DS diskette.
fixed by changing the formatting parameters on the MSDOS system.
2) one or both of the drives is misaligned. fixed by replacing drives :-(.
3) the MSDOS system has a virus which is mangling the boot sector on the
diskettes and confusing the 520.

If you really want to format the disks on your Atari, there's a program
called MSDOSIFY that will do it (and I'm sure there are many others too).

Email me at r.burrows1@genie.geis.com if you can't find anything at umich ...

But x86 code isn't going to go away - nor is 680X0. However both physical chip ranges are reaching the end of what they can do. The way forward has to be emulation. True - this new breed of machines will have native apps - but it will all seamlessly fit together IMHO. :-)

> Few people want to have a crashing Windows 95 on their
> Power-Macs, or other non-Intel machines, I think..

You may be underestimating the power W95 has on the population in general. Sure - nobody wants it to crash all the time - but they will want to run it; Intel inside or otherwise.

> But no: it's like magic (not MacMagiC ;-) . Everybody wants a REAL
> computer with REAL OS and REAL software... And everybody thinks:
> "PC is the only choice. Microsoft is the only choice."

Well I run a PC too - and it does have MS stuff on it (I even paid for it! ;-) However this is out of practicality. I'm currently using my TT to type this - and whilst my Ataris are still useful I will continue to use and develop for them. OTOH there is no reason what I shouldn't be able to play the latest PC games as well! ;-)

:-)

I have found that I needed to put both the STIKCFG file and WWWCACHE
on C: drive. It seems to work for me. I think that the authors made
the assumption that everyone boots off C:. I use F: in commn with one
or two others who have had a problem. Worked for me anyway!

Has anybody got the Enhanced Polyphonic Sample Synthesiser or the demo that came with Atomiman.zip to work on the TT030 as a desk accessory?

Running the demo as a program I can get 8 polyphonic channels from the STE/TT 8-bit stereo DMA chip but it doesn't seem to work as an accessory on the TT030. Is this something I've done wrong, a fault, or unavailable in the demo?

jason.

Since I was curious about Gemulator and read some things about it on the Internet, I just wanted to make comments of my own as well...

On 11 Nov 1995, Eric Palm wrote:

> I ordered 3.0 at the same time as the 4.0 upgrade, not knowing that there
> was a 3.0 on the Gem. 4.0 discs, known as Gem4dos. I installed that one

> But there was absolutely no joystick support, painful to see ST Raiders
> on my DX4-100, and with sound, but no joy.

It's great to know that Gemulator will play games(except for copy protected ones of course). I had no idea about Darek including the DOS version of the program with 4.0, two for the price of one :)

> So, about 3 hours later, I decided enough. So I installed Gemulator 4.0 to
> see about that joystick support I read in the manual (although the

> utility, going back to GEM 3.0 to do so, on a few of the floppies).

Rising Star has a Windows program that makes your ST disks MS-DOS compatible. If you want to know moer about it Eric, I'll e-mail the details.

> WEll all in shot, I could get any games to work, with any sound, and
> there was no joystick support working for me. I checked the windows '95
> control panel to see what was up, I recalibrated the joystick, checked my
> sound settings, even
> played a few Windows, and DOS programs to check my audio output) My
> sound blaster 16 card was fine)

Well even though Darek did promise joystick and MIDI support, he'll actually fix it in the future to registered users. But he said that the MIDI isn't important b/c of copy protection. IMHO, there are MIDI programs that do not have protection and it was MIDI that made the ST big.

> I couldn't see why Darek abandoned the Gem 3.0 entirely for Gem 4.0, as

He claims that Win95 is a better OS which will eventually replace DOS. He
may be right except not everyone could successfully install Win95 on
their PC's(Micro$oft forgot to mention a few things...)

> Gem 3.0 was a much better gaming environment, it supported the TOS 1.0 ROMS
> file, would boot any floppy that was not copy protected, and the sound
> actually worked. If he had gone one step farthur and provided simple
> analog PC joystick translation for the games, I would never use Gem 4.0, as
> I can't get Gem 4.0 and Gem 3.0 environments to talk to one another,
> except for the exchange of floppies, that's all they held in common.
>
> Now if anyone else has had better experiences with these 2, please let me
> know, via E-mail or post to the group.

It was certainly interesting to here your experences, I wish I can get
Gemulator and report some myself. You can get more information on
Gemulator, and what Darek says from http://www.halcyon.com/brasoft/
(And Darek did tell me on how which games work and which don't 'cause I
asked him) :)

Are you using CAB as an .acc or an .app ? I had this problem when using
it as an .acc but it solved itself when reverting to .app. It is working
OK here now (most of the time).

> between and the capabilities of the two, and what sort of hard disk

Basically if you have a 68030 or better - run Linux, else run MiNT. Both
systems are capable - but linux is able exploit the MMU in the 68030 to
great effect (BTW Linux also needs an FPU (68881/2)).

> 520 ST.) I'd also be interested in a SCSI bus to use one of my
> existing Mac hard drives if one exists.

If you have a TT or Falcon (both 68030 machines) then you already have a
proper SCSi interface.

Otherwise an ICD Link 2 or similar is what you need.

:-)

>the producers of this case want you to buy a separate PSU for the mother
>board and each drive.
>Once I know how much space there is, I can get a PC supply which will fit.

I have the Lighthouse Tower for my Falcon. The design is somewhat
strange: It has two halves; the lower half is filled with the
motherboard (and has lots of space left), the upper half is mounted
with the drives. They are connected with hinges. Each half is
approx. 7 cm high (figures from my head). Basically the height is
thus quite limited, the two other dimensions are large enough.

Please let me know what you find out; I will have to install a
separate power supply too.

Hope this helps.

2080. Great ATARI show in PARIS.

Newsgroup: comp.sys.atari.st
Date: 1995-11-15 00:00:00 UTC
From: Mathieu Petrovic <oxo@iprolink.ch>
Message-ID: <48bk4b$1chi@fox.iprolink.ch>
Source record: 156180

Press release.

To satisfy both exhibitors and users, Composcan France and Oxo Concept
are proud to announce that they finally found an arrangement.
Composcan France has agreed to cancel the " Atari Show 3 " and has
decided to join and support the " 1St forum of Atari Applications ".

We believe that this decision can only benefit to the Atari community
and will help the Atari world to find a new enthusiasm.

The " 1st forum of Atari Application " will take place on the 16th and
17th December 1995 in Paris (Porte de Versailles). We encourage all
Atari actors to participate and support this show so it can become a
major international event.

For more details about the show, please contact OXO Concept or
use OXO's Homepage (http ://www.oxo.ch).

Composcan France and Oxo Concept.

2081. Re: Falcon mic input

Newsgroup: comp.sys.atari.st
Date: 1995-11-15 00:00:00 UTC
From: claes.holmerup@p5.dada.ct.se

I came across a discussion about the following:

> : What's the difference between the mic input on my Falcon, and the
> line : in on my PC's SB16? I tried to connect the audio out of my VCR
> to the : Falcons mic in, hopefully to capture some sounds, and it's
> really bad.
>
> The Falcon line in on the original Atari machines cannot handle any
> significant signal levels. Basically it's quality isn't too good to
> start with but when you connect any LINE signals it gets worse. I
> think you can rectify the problem by building a small circuit which
> reduces the power levels.

The original Atari Falcon does NOT have line in/out, but rather mic in (that is phantom powered with 9V) and headphone out. There is a fix for this that modifies the in/out to true -10dB line levels. I can provide this if needed, but it requires soldering surface mounted resistors and capacitors, so if you're not VERY experienced with a soldering pen, you shouldn't do it yourself.

> Fro what I gather the new C-Lab machines have better quality mic
> sockets, but I'm unsure if they include line in/out.

The C-lab machines have been line modified from the factory and no longer have mic in/headphone out.

When going through some mail I saw the following:

>>
>> Can I replace it with a generic PC 720/1.4 floppy drive? Plug and play
> as it
>> where or do I need an ATARI specific disk drive, special chip or
>> cable? [...]
>
> Well, I had to, some time ago, and the new drive worked out of the
> box. If you still have the motherboard in its original housing, you
> will probably have to do some filing around the select LED hole.
>
>> Do dips need to be set, the room rearranged or sacrifices made? I know
> less
>> [...]

Most PC drives are set to drive select 1 from the start, and this has to be changed to drive select 0. Otherwise the ST can't recognize the drive. Another thing: you'll probably have to twist the flat cable around too, otherwise the drive will only spin and won't be accessible. The 'key' in the PC-drives' flat cable connector is on the opposite side than in Atari's. After this it's just 'Plug and Pray...'.

Best regards,

Claes

Tommi,
I agree with you. Companies complain about poor sales for the Atari platform yet people cannot find their products to buy! If Microprose is out of stock on a game wouldn't that suggest that sales reached their expectations? Or perhaps someone can explain to me how this works. There shouldn't be a problem producing more. The packaging is the same as the IBM. The only thing different are the disks.

neil martin (martinna@cf.ac.uk) burbled gracefully:
: Can someone tell me how to set the Function keys in uniterm so that I can
: use BT's Phonebase under vt100 emulation? I have found the relevant
: dialogue box but I need to put in the codes

: esc-P-O
: esc-P-Q

: and another one beginning with esc (which is obviously the problem).

Yep, it's control [when you're in the function key setting bit.

Likewise control m gives you a return after the ^[PQ

It should look like a little esc diagonally across the font thingie.

Cheers,

Paul.

: What can I do??

I believe that that is an external single-spin NEC SCSI drive correct?

If so you need a SCSI II cable to connect it(if you don't already have one) and a copy of ExtendosPro (or MetaDos, if you can live with the lousy job it does)....

Hope this helps, if the drive is something different than above send me some E-mail

2096. Printer drivers for PGS

Newsgroup: comp.sys.atari.st
Date: 1995-11-15 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <95111504000822309@acpu.com>
Source record: 156196

molin@cxc1.cl.msu.edu (Michael Olin) spake thusly:

MO> Subject: Printer
MO> drivers for PGS I'm looking for two specific printer drivers
MO> for use with PageStream 2.2b, please let me know if these are
MO> available and where:

MO> Epson Stylus Color

Is on ST Informer's disk of the month for December 1994.
STYLUS_C.LZH. This is the description from the ST Informer read.me -

STYLUS_C.LZH - Updated Epson Stylus Color Printer driver for
PageStream v2.2. This driver has improved page formatting. Uses a
data compression algorythm. Prints in 180x180 dpi, 360x360 dpi,
720x720 dpi.

I will attempt to UUEncode the file (it would be my first attempt -
don't get your hopes up!) and email it if you can't find it
elsewhere.

Can't help you with the other two printers.

"The Poor Deluded Soul" - tderrick@acpu.com

... Any simple idea will be worded in the most complicated way.
___ Mountain Reader II - #00000077

2099. WTB: Hard drive for 1040STf...

Newsgroup: comp.sys.atari.st
Date: 1995-11-15 00:00:00 UTC
From: grendel@bluefin.net
Message-ID: <grendel.21.0017E074@bluefin.net>
Source record: 156199

Hi there. I recently bought a 1040STf computer, and would really like to put a hard drive in it (i must've forgotten how horrible floppy-shuffling can be!). I've been told that the only kind of hard drive that can connect directly to the hard drive port on the back of the computer is an older Atari "Megafile" hard drive. I'm still not 100% sure what one of these is. It's my understanding that it's an old mfm drive in an external case with some sort of adapter or controller built in. I've also been told that these drives are large, noisy, slow, and hold a minimal amount of data... but, to be honest, I don't really care. I just want something to eliminate all the disk switching that's making my life miserable ;>. Besides, i can always upgrade to something nicer in the future, anyways. But my biggest problem right now is money. i bough the ST from someone nice enough to give me an excellent price on it, and i don't need anything extraordinarily fancy. Just something that works. So if anyone out there (in the states) has an old megafile drive sitting around collecting dust, no matter how small, please leave me some mail with asking price and stats. I'd really appreciate it. If you have an ICD Link2 or anything of the sort that you'd be willing to part with for a reasonable price as well, drop me a msg as well, but, like i said, money is really tight right now (I'm only a senior in HS saving for college...). Thanks much for any offers or information,

NiCK

2100. Uniterm question. Very easy.

Newsgroup: comp.sys.atari.st
Date: 1995-11-15 00:00:00 UTC
From: martinna@cf.ac.uk
Message-ID: <DI371C.2IE@cf.ac.uk>
Source record: 156200

Can someone tell me how to set the Function keys in uniterm so that I can use BT's Phonebase under vt100 emulation? I have found the relevant dialogue box but I need to put in the codes

esc-P-O
esc-P-Q

and another one beginning with esc (which is obviously the problem).

TIA

Neil

2101. ST Basic -> Hisoft Basic (quite long)

Newsgroup: comp.sys.atari.st
Date: 1995-11-15 00:00:00 UTC
From: jpb3@ukc.ac.uk
Message-ID: <13733@gos.ukc.ac.uk>
Source record: 156201

[Article crossposted from comp.sys.atari.programmer]
[Author was J.P.Beranek]
[Posted on Mon, 13 Nov 95 16:21:37 GMT]

For the last few days, I've been desperately trying to convert an old ST Basic (yes I know, *puke*) program into Hisoft Basic. The first thing I did was just load it straight in and see how well it compiled.

It compiled OK, but there were a few bugs with the "graphics". I therefore started looking through the code, and trying to clean it up. No small task when all the control the program had was GOTO and GOSUB!!!!!

I've now got it reasonably respectable (i.e. subroutines everywhere, except for the main code, which is totally inpenitrable). The only problem is that there are a lot of weird POKE's around that I wish I could understand. I figured one type out, which drew a rectangle. It took the form:

```
POKE PTSIN,x1:POKE PTSIN+2,y1:POKE PTSIN+4,x2:POKE PTSIN+6,y2
```

I've now replaced most of these with the rather better:

```
v_bar x1,x2,y1,y2 :) :)
```

Below is an (admittedly rather long extract) of the code, I wonder if any of you programming gods (sluuuurp!) could help me decode some of it.??

```

I also tried redoing some of the mouse handling routines, but gave up when I couldn't get vq_mouse to work... :(

Below is a typical mouse handling routine (it draws 2 boxes, labelled yes and no, and allows you to click on either one)

At the moment it still uses the horrible PEEKS to read the mouse position. The problem is that well, it doesn't work! Anyone tell me what's wrong with it??

/\/

```
FUNCTION yes_no:
STATIC mx,my,mb
sub2
ding
v_hide_c
v_rbox 500,172,549,184
v_rbox 551,172,600,184
text 514,181,"YES"
text 568,181,"NO"
v_show_c 0
sub49

DO
DO
VDISYS(1)
mb=PEEK(INTOUT)
mx=PEEK(PTSOUT)
my=PEEK(PTSOUT+2)
LOOP WHILE mb=0
LOOP UNTIL mx>=501 AND mx<=599 AND my>=173 AND my<=183

IF mx<550 THEN yes_no=1 ELSE yes_no=0
END FUNCTION
```

/\/

Thanks for any help I may get.....

John

P.S.

Just in case anyone cares, the program is actually a bridge playing game
which is really quite good. OK, not exactly very graphical but still good.
I want to recompile it with Hisoft Basic, because running it in ST Basic is
painful. So SLOW!!!

CalamusSL runs almost the same speed in 256 color mode as on 16 color mode.
It muuuch more comfortable working in CalamusSL now.

It's a comic compared to Atari World. STF still carries the ST Review
logo on it's cover, but all the STR writers went to AW. Get your store
to stock AW and do all your local Atarians a BIG favour.

All this IMHO of course (but I am right).

Let's face it most home computer users use the above excuses (along with
Multi-Media and Education) to get their new PC's into the home. Really
though they just want access to the games that are available on PC's.

>

But the majority wouldn't know W95 if it stared them in the face. They've
just fallen for the Ad campaign. (as promoted bt the neutral PC mags)

> and it certainly won't be with the ageing ST/Falcon design.

Which is true, but still doesn't cover the fact that for most home users,
ATM this would be plenty.

Not everybody is computer literate, maybe they should be, but they're
not (yet). The Atari platform as it stands now WILL give a very good
grounding in computer skills to many first time users.

Then let's let the future take care of itself.

> it?

Yes it does (sort of). I downloaded www108.zip from hensa and was online via CiX within 20 minutes. Yes, I've had a few probelems and I still get the odd run time error.

I lost all the read errors when I used CAB as an .app rather than an .acc

Other than the fact I've registered the package via Interactive I have no connection with it.

Yes there are still problems, yes it takes time to set up and yes it can be a PITA, but it does work, and hopefully will get better.

The www108.zip package also has Demon scripts I believe. Is this the version you have. The CiX scripts certainly worked. I have had 100% success with STiK.

```
: Does anyone know of a utility that can fix the infamous TOS bug that does
: a directory refresh addinfinitum?. This bug occurs frequently on my
: Falcon when I am viewing pictures/animations with the APEX media viewing
: utilities. It requires the user to use the mouse and click frantically on
: the top right icon (close top dir.) until back to a clean desktop. This
: bug REALLY annoys me so is there a fix for this one????

Hi,

This is not a TOS bug, it's the APEX viewers that are bad programmed. I'm
pretty sure that this problem is gone in the latest versions of the viewers.

|>>"ANONYMIZED?"

It means that you will automagically be assigned an anonymous number on the anon server which will forward to your other account. This forwarding address is yours forever, as long as you keep the account it was made for, anyway. So whoever you reply to won't know who you are, unless it's in your sig, of course. You can then use that anonymous address to post to usenet to, for example, email to comp.os.vms@anon.penet.fi

>Or - as I suspect - does the copyright not allow such a procedure?

This is illegal, as far as I can tell. A better solution would probably be to
make STonX fake some of the Mega STe hardware just well enough to get 2.05 to
run. Fortunately, I still have my old 2.05 EPROMs, so I might be able to do
that (no promises though, since there are higher priority issues to be dealt
with at the moment).

Source record: 156074

To uuencode/decode is quite easy, just use ESScode the others have nothing to do with uue/uud at all, they are just other programs the author has sent you, e.g. masterbrowse is (afaik) a text editor.

Just run ESS.prg go to file click on UUEncode File and up will pop the file selector, all you do then is find the file in the disk/HD partition that you want to "ENCODE" click on it and the program does the rest.

To decode a file do the same thing but go to UUdecode File and find a file with the .uue extender to decode....simple!

> any solutions for STiK and CAB?

My experience is that STiK version 1.0 and CAB-version 1.07 are working fine together. All other combinations bomb out, or freeze the system with messages like 'connecting to host' (if you are lucky) and 'receive 0/0 bytes' (if you are lucky-lucky).
I use 1040 STF, 2.5 meg ram and Megafile 44 removable HD.
I assume that the OVL-file hasn't changed since introduction of the STiK-package (Adam?)

regards,
Marc

---
1. Novice-Question : How do I recognize Windows ?

If your screen is invaded by countless silly little icons no one is able to
understand, if your computers speed is reduced to almost zero, if your hard-
disk is full, if you can't start your normal programs anymore, then indeed
you have made the fatal mistake of acquiring Microsoft Windows !

---
2. Virgin-Questions : What exactly is Windows ? Why do I need Windows ?

Windows is a form of modern warfare. It's yet another attempt of the elec-
tronics industry to rape and destroy the minds of its unsuspecting victims.
And of course you don't need Windows. It needs you. Bill Gates needs you to
buy it to get even more rich and hateful. Rumours that the Windows project
was originally launched by psychiatrists to provide them with a constant
source of new patients have not been confirmed yet.

---
3. McAfee-Question : Is Windows a virus ?

No, Windows is not a virus. Here's what viruses do:

1) They replicate quickly - okay, Windows does that.
2) Viruses use up valuable system resources, slowing down the system
as they do so - okay, Windows does that.
3) Viruses will, from time to time, trash your hard disk - okay,
Windows does that too.
4) Viruses are usually carried, unknown to the user, along with
valuable programs and systems. Sigh... Windows does that, too.
5) Viruses will occasionally make the user suspect their system is
too slow (see 2) and the user will buy new hardware. Yup, that's
with Windows, too.

Until now it seems Windows is a virus but there are fundamental differences :

Viruses are well supported by their authors, are running on most systems, their program code is fast, compact and efficient and they tend to become more sophisticated as they mature. So Windows is not a virus. It's a bug.

---

4. Lamer-Question : Are there any cheats for Windows ?

Repeated pressing of ALT-F4 RETURN is said to enhance the quality of the working atmosphere. The same effect can be achieved by pressing the reset button of your computer.

---

5. Critics-Question : Why is Windows as bad as it is ?

If Windows were bug-free, fast, easy-to-use, compatible, openly structured,
cheap and efficient, in other words if Windows were a good operating system,
there would be no need for Microsofts daily updates (also called bug-changes)
with which they trick the money out of their customers pockets into their own.
Also, such an operating system would not come from Microsoft, it would come
from real programmers.

---

6. Nintendo-Mutant-Question : Is Windows a game ? Do I need a joystick ?

Yes, Windows is a game ! It has all the characteristics of a game : It has color graphics, sound, there is movement on the screen and the user has to press keys or use the mouse to play it. It's difficult to solve Windows or even Windows NT, but there are quick-guides or, for the inexperienced, complete step-by-step walk-throughs (see also Lamer-Question). There is no need for a joystick as Windows supports both keyboard, mouse and telepathy (think of a system crash and you get one).

---

7. Programmer-Question : Are there any standards for Windows programming ?

Of course there are. More than you can count. In fact, the wonderful thing about Windows programming specifications is that there are so many you can choose from and that they change from version to version. Not to forget the fact that no other program running under Windows makes use of them. All in all there's only one thing you need to know : Real Programmers don't use Windows.

---

8. Sceptics-Question : Is this text making any sense at all ?

As this text is about Windows, it cannot have any sense. It's a stupid text about a stupid would-be-program. It's kept close to the characteristics of its subject : It's funny, senseless, useless, and time and space consuming.

---
9. Version-Question : What's the newest version of Windows ?

"Kairo" and "Chicago" are out of date. After first test runs, Microsoft decided to rename their projects to the more appropiate titles "Titanic" and "Hindenburg". The alternative set of names "Atlantis" and "Tschernobyl" has been discarded. Rumours of other project names like "L.A.", "New York", "Irkutsk", "Chongqing", "Uppsala", "Claudia Schiffer", "Micky Maus", "Buy Me", "Schoppe" or "Extended Error 17" have been discarded.

---
10. Utility-Question : Is there a tool that takes care of Windows ?

Yes ! Look out for the new V4.2 release of KillWin, available at all well stocked computer stores and mailboxes. KillWin V4.2 features auto-detection of Windows on all drives and four modes of operation combined with optional full purging and packing. Average savings of hard disk space exceed more than 20 MByte, average working speed is increased dramatically and user happiness is made possible.

---
11. Defender-Question : How can I protect my system against Windows ?

The easiest way is to make McAfee's Scan recognize it. To do this, create a file (e.g. "winvirus.txt") with the following content :

#The two-faced sinister Windows Virus
"e87928bbf6048be3", Microsoft (R) Windows

(Don't forget the return at the end of the last line !)

To check your programs for viruses, start Scan like this :

SCAN /EXT WINVIRUS.TXT

Note that if the file is not in the current directory, the full path name must be specified, e.g. scan /ext j:\dos\tools\virus\scan\ext\winvirus.txt

---
99. Bill Gates-Question : Are you nuts ?

Yes of course, Windows made us so.

Ah yes, but which system did you have more FUN with? A C-64 (or take
your pick) or an off-the-shelf PC?

Personally, I had more fun with my PET 2001 and VIC-20 then I ever did
with my PC. For me, "fun" qualifies as stuff like how easy is it to
get into and hardware hack (or even software hack). Given the "openness"
of PC's, what with ISA, PCI and all the rest, one would assume it is
easier to get into a machine and hack around, but that just was never
the case for me.

Definitly agreed :-)

A have a Falcon with with 4 MB FastRAM, and it really flies after installing FastRAM.

> My question is this: I have seen some posts which mention to have your

I wish I knew, i've only seen a few TT's in my "Atari"-life.

By the way, are running the LiNUX distribution from the Delta Labs Media CD ?

Keep Cool and Flying...

Cash is good, but I'll consider trades. I'm looking for video games or
electronic toys.

I'd prefer buyers to pick up (Seattle area), but I'll mail if needed
(buyer pays shipping).

Any resonable offer accepted. BIG discounts for bulk buyers.

B-Box, M-Manual, C-Cartridge, D-Original disk

Atari ST items - $300 for the group or individual offers

520ST w/ 2.5 megs, mouse and manual -$40
monitor master (color/mono switch) -$5
SLM804 Laser printer w/ extra drum, 2 interfaces, manuals & box - $150
1224 color monitor (don't know if works, never used it) -$20
spectre GCR w/ ROMS w/ M,B,D -$30
ST syncro express - $10
(2) Mega 30 hard drives - $60 each
shoebox drive w/ ICD, 30 & 60 meg disks - $80
16 MHz accelerator (creative microsystems) - $15

software-B,M,D - $5 each or $40 for the group

Ultrascript type collection
Warship
Red Strom Rising
F-15 Strike Eagle
World Games
Jewels of Darkness
Sub Battle
Silicon Dreams
Flight Sim II
Harrier Strike Mission
Silent Service
Leader Board Birdie
Bridge 5.0
Drakkhen
Chronoquest
Barbarian
Battletech

>on the Atari. I also occasionally run Cubase but it is my 2nd choice.

I've got Notator SL and I find it to be a generally good program
(though I haven't learnt half of it's features- life's too short to
read through "phone book" user manuals for every piece of software
there is).
But it is a trifle old fashioned in many ways- I'd really like an
update of it to bring it up to 1995 standards, and be a little more
compatible with other software. I've heard that C-Lab/Emagic doesn't
support it any longer- is this true?

Does this mean that my investment has gone to a total waste?
I have version 3.1 (can't remember if it was 3.12 or what).

2140. Piracy? (was Re: STonX on HP9000/700 w/ HPUX9.05 and TOS 2.05)

Newsgroup: comp.sys.atari.st
Date: 1995-11-16 00:00:00 UTC
From: Hans-Martin Vogt-Ostmann <hampf@ubka.uni-karlsruhe.de>
Message-ID: <Pine.HPP.3.91.951116100301.16957E-100000@ubkahp1.ubka.uni-karlsruhe.de>
Source record: 156095

Hi,

aha, developers always listen on the net :-))
This almost always happens to me, when I post a question. One day later I
get mail from THE person who must know. Great thing, this internet :))

> >Could it be, that STonX doesn't work with TOS 2.05?
> Bingo! [...] this can't work. Sorry!

I feared this would be the cause :-(

But then for another question: Since I own an STE and I have bought TOS
(unfortunately 2.05) with it and I cannot use STonX at work and TOS at
home simultaneously and TOS 2.06 is not different to 2.05 except that it
works on other STs as well and insofar would make no difference for me to
have or not, since it would be the same for me and my STE and the
TOS-Upgrade only costs money because of the act of burning some EPROMs and
dealers wanting to earn something for their living and - I hope you are
still with me - so the question comes to my mind:

Is it piracy to make a diff-file for upgrading 2.05 to 2.06 or does one
have to buy the (EP)ROMS? In general: Does the TOS in itself cost money
or the manufacturing process/material and the distribution via dealers?
Or - as I suspect - does the copyright not allow such a procedure?

... just to add a bit to the ongoing *piracy* discussion

So long,
Hampf

TOS 2.06 is available in two ROMs for less than 100 DMs (70 US$s) in
Germany. If you can prove to anyone you own a legal copy, some people
might very well hand you an image file of it.

How about your Mother-in-Law, Jason? :-) Seriously, hardware/software companies want to shove down our throats what they think is good for us (well... good for their bottom lines) instead of developing something that we need. My poor dad just bought Win95 for his 386DX33. Lucky him he's got 8MB RAM.

: formatter such as Diamond Format.

Not true. Beginning with TOS 1.04, the disk format is *completely*
DOS-compatible. Before TOS 1.04, some clones had difficulties, but
only because they didn't really implement the full Microsoft
specification for detecting the disk parameters from the bootsector.
(Those clones just looked at a single byte in the bootsector,
the media byte, and derived all other parameters from it.)

NP> the only kind of hard drive that can connect directly to the
NP> hard drive port on the back of the computer is an older Atari
NP> "Megafile" hard drive.

Supra put a Miniscribe (20Meg) into a shoebox quite a few years back, with a DMA cable out the back. The old Miniscribes seem to last forever - our club has one that ran a BBS for seven years, been in the possession of many members, been transported incessantly, and still works, although its bearings are obviously not what they used to be.
There may be others that were built for the ST.

NP> I'm still not 100% sure what one of these is. It's my
NP> understanding that it's an old mfm drive in an external case
NP> with some sort of adapter or controller built in. I've also
NP> been told that these drives are large, noisy, slow, and hold a
NP> minimal amount of data.

They are all of that. But the one I've got is still readin' and writin', so what the hey. (Sorry to get your hopes up - I'm not selling.)
Somebody posted here a while back that Brad at Best Electronics in San Jose had bought a bunch of old Megafiles and was selling them pretty cheap.

I think your knowledge of America's Radical Right is a little deficient (please, no flames - I know even less about other countries' politics - I'm just an ignorant, provincial American). As a proud member of the Radical Right, I can read offensive material and support one's right to post it - I just develop low opinions of those who do so. I may disapprove loudly. Free speech, and free thought.
I'm not sure that a killfile would have caught that bit of doggerel about drowning one's daughter. The person who was offended by it was well within bounds when he said he was offended. Remember, he is not a government.

Source record: 156109

Hi, I have a question about the Advanced Music System (1 and 2) files that are availible. I downloaded ALL of them from the archive at UMICH (atari.archive.umich.edu). I used to have a program many years ago that converted them into Music Studio Format, if that is on the same site, what is the name of the file? If isn't on there where does one go to obtain it?

Also, is there a player for the ST of those? I don't mind if it is a .TTP, .PRG, or a .TOS extension, I would like to play those. It does not matter if it is MIDI play only or not, I would prefer one through the speaker.

> READ, NOT WRITE!

Well, I found something out. I remember people here saying that System
7.5 will directly read PC formated disks. I started thinking that it's
the latest version and a good place to look for it is on the Power Macs.
So I went to a computer lab that has PowerMacs and it actually works. YEAH!!
Here's a rule of thumb, under the Apple menu(you must be in the Finder)
select About this Macintosh... If it says in the dialog box system 7.5
or higher you win(must likely on a Power Mac). Any lower and you need a
seperate ulitity.

Thanks to everyone to reply :)

A small footnote, TOS 1.4 or higher will format 720K floppies in DOS
format in the Format option in the desktop. But I use M-Disk accessory
to do the DOS formating and it works everytime :) To format a DOS disk
with any formatter, use 80-9 double side. Thanx, and enjoy :)

Hi All,

Making progress with the old 520ST. Got the 4 Meg RAM kit from Toad installed last night (late, last night :-). With the exception of having a slighly screwed up MMU socket, all went well. Installed MagiC and got that running. Now I just need to get power to the ICD Link II somehow, so I can run my SCSI Zip drive on the system. Feeling good about it and to give credit where due, Toad was VERY helpful and efficient with the few questions I had !

Need to find some critical utilities, like a text editor for one, any recommendations for a good PD or shareware would be appreciated. I got Jove (a vi clone) off the net, but it wouldn't run, just bounced me back to the desktop. A vi clone is OK, but something more along the lines of Qedit/Tse would be nicer :-).

Appreciate all the assistance I have gotten from this group, its kind of neat and amazing that the ST is still going strong. I'm having a good time playing with it and even having a few tools of serious content !

Thanks again ! Take care, Vikki.

Wrong. YOu go to a shop, lay money on the table and take home the
software. You _bought_ it. Thus it's _yours_. Any "license agreement"
that's in the package is null and void. Just imagine if you bought a car
and afterwards find out that the motor is not included due to the "sales
agreement" the dealer presents you afterwards - ridiculous.

>
> Which is true, but still doesn't cover the fact that for most home
> users, ATM this would be plenty.

But the average home user is not going to see it like that. Compare even
something common like Encarta - to what is available for the Falcon - and
there is no question which they will pick. The fact the they will be
playing with a powerful machine which can do much more is not the point.

> The Atari platform as it stands now WILL give a very good
> grounding in computer skills to many first time users.

I don't think its computer skills they are after. Its the 'Wow' factor
which gets much PC software sold. The Ataris may be worthy machines - but
quite frankly don't have exciting enough software - and this is mainly due
to lack of power and decent support chips (DSP excepted).

> Then let's let the future take care of itself.

It sure will - I have no doubt.

:-)

2169. SpeedUp - 50MHz for Falcon!

Newsgroup: comp.sys.atari.st
Date: 1995-11-17 00:00:00 UTC
From: Szymon Stasik <stasik@bull.mimuw.edu.pl>
Message-ID: <Pine.BUL.3.90.951115213625.29010C-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000@bull.mimuw.edu.pl>
Source record: 156009
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

So finally I've got the new SpeedUp accelerator installed in my falcon.=20
It is the first accel with internal CPU working at 50 MHz and BUS at 25MHz.
It works great! All the windows and dialogs just flyes, all the mpegs are=
=20
running much much faster, virtual memory looks more stable, and so on,=20
and so on :)) The only problem is that blitter can't handle 25MHz speed,=20
but lets look forward at software blitting performance! And one more good=
=20
news --- Linux works just perfectly (12.33 BogoMips). So now here are=20
tech info:

CPU can works at 16/20/25/40/50 MHz
BUS handles 16/20/25 MHz
DSP is configurable for 32/50 MHz
Videl is timing by 50 MHz clock (it allows to run 800*600 in HiColor on MS!=
)
FPU acorddingly to the nominal speed can works at 40-70 MHz=20
(if present on the system)

Known incompatibilities:

At 25/50 MHz modes blitter has to be turned off or switched to it's half=
=20
speed (12.5MHz). So some applications can unfortunetly switch the blitter=
=20
on without any warning.

Some applications can claim exact timings while DSP transmisson, but for=
=20
the moment the only one is mgt-player 1.05-1.15 (previous versions works=20
well).

There should be "easy to install" version available at december '95 /=20
february '96.=20

The price is 150$ + shipping from Poland.

And here are some benchmarks:

GEM Bench v4.02 =BD Ofir Gal - 16 Feb 95

A friend of mine wants to sell Spctre GCR with System 6. Is this a good idea? I use a Mac with system 7 at CKDU-FM and like its multitaksing. Is System six limited in this? Would I be limiting myself from new software development by using an older OS? Is older good software available or is it disappearing like 5.25" based programs fro IBM 286?
Any info or opinions appreciated!

:>This is illegal, as far as I can tell. A better solution would probably be to
:>make STonX fake some of the Mega STe hardware just well enough to get 2.05 to
:>run. Fortunately, I still have my old 2.05 EPROMs, so I might be able to do
:>that (no promises though, since there are higher priority issues to be dealt
:>with at the moment).

The crash with TOS 2.05 is caused by a write to FFFF8e21, which enables the cache/16mhz 68000 in the MEGASTE. This is trivial to fix :-)

2173. Re: megaste with more than one SCSI hard-disk?

Newsgroup: comp.sys.atari.st
Date: 1995-11-17 00:00:00 UTC
From: enagel@ams-co.bru-ro.dhl.com
Message-ID: <48is8b$8q6@tuegate.tue.nl>
Source record: 156013

Question:

does the Mega STE SCSI adapter need parity or not? And how do I tell if my Mega STE has a SCSI
adapter (2nd hand so I don't know if it has one).

Does anyone know if the Mega STE with internal SCSI can work with a Quantom Prodrive 80S?

Please reply in e-mail (enagel@ams-co.bru-ro.dhl.com)

Erlend.

I know, who can really afford a $2000 computer and not use have the stuff
that's on there. People don't even know WHAT is on their PC.

You absolutly right, people are better off with $400 home comptuers than
$2000 office computers.

Maybe someone can buy the STe design and make such a computer, the
Germans did the same thing with the TT and Falcon.

> No, it wouldn't be completely compatible with work computers, but
> that's the whole point...this is a *home* computer (but you could build
> in RTF and text saves for the occasional text you need to bring in to work).

I'll do you one better and suggest why try to adapt the PC design into a
more simple efficent machine, designed much like the ST. I always thought
of a way to turn the PC into a $500 game system for playing games, but
with simple applications that use files from office computers and
one-stop Internet connections; people will prefer this option.

> I can see the Atari ads for this:
>
> Q. "Why is a game company putting out a new computer?"
> A. "Because all the big guys took the fun out of home computing and we know
> how to put it back!"

Actually I rather Atari did not do this themselves since this is an idea
that should "suceed". Pity Atari won't make the Jag computer that uses
TOS; or how about a Jag PC that uses an Intel and a BIOS but runs VGA and
Soundblaster emulation off the Jag chips?

>
> Do we?

Of course, but I doubt the rich PC industry would want to give up the
monopoly considering they make money off of soaking consumers who don't
even speak up.

Currently NetBSD runs on TT and Falcon. You can it ftp from ftp.netbsd.org
or one of the mirrors.

2176. HP Deskjet printers and Atari...

Newsgroup: comp.sys.atari.st
Date: 1995-11-17 00:00:00 UTC
From: thietavu@news.abo.fi
Message-ID: <48j3qc$kok@josie.abo.fi>
Source record: 156016

I've been wondering whether I should get myself a DeskJet 600, or even 660/850. But what really worries me, is the situation with driver software.. =(

Does anybody know, if those new 600 DPI ColorSmart-models use some kinds of special driver programs (something one can't build by just adding a couple of new ESC-commands into our DJ 550 drivers) ..? Can we really use these new DeskJets AT ALL - or are they meant for Windows/Mac-users only?

Does e.g. Laserjet IV -driver of NVDI or Calamus SL work with their 600 DPI mode? What happens if I try to print in color using DJ 550 driver..?

This is serious; how can we use the newest printer technology - or can we at all? And you there, who make software - will any DeskJet 600..850 drivers for Calamus SL, NVDI 3, DA�s Picture, etc. be available publicly at all? And if yes, where and when?

I really dislike the idea of waiting for months for some update, just for perhaps one printer driver. I think, updates like these should be public domain, and widely available.

Greetings,
TH

>
> Adrian
>

From what I understood it was the other way around, Nintendo using their awesome might (read: lawyers and buyouts), bought Giana sisters off the authors. There's no way anyone would copy a Nintendo game _that_ obviously, I think the _original_ Great Giana Sisters was released a fair bit before Mario World was. (It was originally released in about '86 or earlier even, on some of the 8-bit systems).

Atari invented the joystick, and any company using them had to pay royalties to them. So, Nintendo/Sega (one of them) invented the %($%&* joypad to get out of paying Atari, and we've been paying for it with RSI of the fingers ever since!

I remember the version of Great Giana Sisters I played originally was on the Commodore 64, and was a crack by a group called "Hotline" (the things you remember eh!? :) Still a fun game, which is what's lacking in games today, too much flash, and not enough good old fashioned gameplay!

2180. Why is Lattice C so slow?

Newsgroup: comp.sys.atari.st
Date: 1995-11-17 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <48hco5$7o0@inca01.inca.co.nz>
Source record: 156020
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Spencer Davies (Spencer@mettav.demon.co.uk) wrote:
> am now using an unaccelerated Falcon instead (why are compiles under Lattice
> so slow????)

Because Lattice insists on making two passes through each file, and
writing the info out to disc as it does so.

Laser C (by Megamax [who are no longer in business, I believe]) only ever
made one pass through each file and only ever wrote the data out to disc
when it had to - everything (source, headers, object, executables etc)
were cached in RAM by Laser. The Laser C cache dynamically resized itself
as needed and flushed itself to disc when it became full, or you quit
from Laser.

(I used Laser C from 1989 to mid-1991, when, having become sick of
waiting for the ANSI upgrade to "K&R" Laser C, I bought Lattice C.)

So, my Mega ST at 8Mhz with 4Mbytes of RAM was almost as fast using Laser
C as my 20Mbyte 32-Mhz TT is now using Lattice C 5.6.

If you want to speed up compilation, set your QUAD environment variable
to point to a RAM disc, and put all your headers and libraries in there
as well. This will speed things up, but dont expect miracles.

I thought that the Link II can get power from the ST with no problem,
but I might be wrong as I don't have one. Dave Troy can help you out
on that, he's very dependible :)

> Need to find some critical utilities, like a text editor for one, any

If you want a good text editor, I fully recommend Edith 1.0. It's
shareware, very efficent, and they have a commercial version(Edith
Pro)if you want to upgrade. Check the Umich site for some more
Ulitities, I would say also check Hensa but it's close to outsiders
half the time.

> Appreciate all the assistance I have gotten from this group, its kind

: Um, just exactly how do you apply a killfile to .sigs?

You don't. Just put blinders on, they should work almost as well. Use a kill file on the subject line. Filter out all the words you think you should not be reading (but seem to know already), then while you're at it filter out some more. And you can filter out authors you disagree with and all subjects you might disagree with. While you're at it, if American, write your congress-person and tell them that you would like to see the first Amendment abolished so you can restrict speech on the internet (you might also want to write Senator Exon and give him your blessing). Sacrifice a few chickens too while you're at it, it might help. Don't forget to lock your children up in the basement and shelter them from the real world. Remember, they probably heard all these bad words at school already if not on TV. And don't forget about all those violent video-games and cartoons out there. Also remember to support your local book-banning organization, titles you might want to restrict include "The Scarlet Letter" and more (I can't think of any others off the top of my head). Also don't forget to let your children stumble blindly through the "real world", don't communicate with them and explain to them what sex is, why its wrong to hurt other people, and how to vote repressive people into office, so they grow up with all sorts of hang-ups. I might have left a few things out but my mind is probably filtering them out because they're bad things.

The demo works fine as an accessory on an STe. It needs EPSS.INF in the root directory. If the other files (MIDI, samples etc.) are not also in the root directory you'll get some file selectors to choose the path. Smart. Otherwise I don't know what the problem is because I don't have a TT :(

From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DI64wx.D4A@actrix.gen.nz>
Source record: 156130

Just a note to all. Several months back I sent Dave Munsie the appropriate money to register his "Choplifter '95" game which he reckoned was done. Despite dozens of emails to all his various addresses, I've had no response in the way of a reply, a disk, or money. So, unless you can get confirmation from him first - don't send this man any money! His games are on the whole, pretty good, but when your cashflow is more of a trickle as is mine, I could certainly use the money I've sent him for something practical such as petrol - doesn't look like I'm ever going to see anything of it. This is my last straw as far as Shareware goes, I've had enough of getting no support for the dozens of items I've registered. Either I choose which to register very unluckily, and just those particular titles are dropped by the authors, or there wasn't enough support for the authors in the first place.... (One I registered had been out for months, and I was the _first_ user outside of the programmers home-country that had registered!). So, if you're going to register Shareware, make sure the author has plans to continue support for it, I for one have given up on the whole concept, it's cost me too much, for what has basically amounted to a couple of unlocked features from the key given to me upon registering.

I heard that the Great Giana Sisters was a rip off of Mario World,
Nintendo stopped them from publishing it, claiming that it was a "copy"
of Mario. If Atari had this attitude, then no-ome else would have
shoot-em ups (since then did space-invaders) and 3D stuff (they did
battlezone/tempest) ....

You could download www108.zip from Hensa for him. That is WEB browser
and the equivalent of Trumpet Winsock. (Except better IMHO). It does
fall over occassionally but it is being developed. The other package
is OASIS which does everything except browse the WEB. ie IRC. FTP etc.
As long as he has a suitable modem you should be able to set him up. I
am afraid he will need some help if he isn't computer literate.

Look at Atari Stocks right now. It is pretty low (lower than C=
at time it delared Bankrupcy). I doubt Atari is in a position to do much
at this moment. At least C= Int'l and Amiga were bought be a fairly descent
sized company that has injected some much needed funds now.
BTW, given that I am a person who believed in dedicated systems
(in my room, I hone one Server dedicated for printing, one for rendering,
one for Web browsing and FTP, one for News, one for email, etc...), is there
any one good reason that I should get an Atari? What is the ONE good thing
that Atari can do that most others can not compete. Below lists system and
its job:

Alpha 233 Chinese WinNT 3.5 Web Creation/Rendering
Alpha 300 DecUNIX NewsServer
Duel Pentium English WinNT 3.5 Audio, CD recording
Pentium NeXT 3.3 Web Server
486/66 SCO V. 5.0.0 E-mail
Amiga 2000/020 Amiga UNIX 2.1e free_access
Amiga 3000/030 Amiga UNIX 2.03 ftp server/fun machine
Amiga 4000/040 Workbench 3.0 Toaster,Mac Emulation
Amiga 500/030 Workbench 2.1 Demo system, Mac Emul.
Rack A500/000 Workbench 1.3 Test system
Pentium XXX Firewall
NeXT Cube/040 NeXT 3.3 Web backup/2nd DNS

I want an Atari (there is a convention or fair of somesort comingup),
but I first want to know what it is really good for so I can properly
prepare. Thanks...

While I think that such a machine might have a good market, it's not what
I would call a "fun machine". For me, a fun machine also must have
a technical edge over other machines, and it must open new fields
of applications or trigger new ideas. The ST and the Falcon had this.

2203. New files

Newsgroup: comp.sys.atari.st
Date: 1995-11-17 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DI64L2.Byu@actrix.gen.nz>
Source record: 156137

Having a hunt around the archives, I actually managed to find some stuff that wasn't Falcon specific, or required me to plug in my monochrome monitor or learn a foreign language! :)

The big thing for me was a Guitar tuning/scale program that lets you basically have a database of any desired scale or tuning method you might like, and then lets you play the appropriate sounds through your MIDI device (uh-oh, MIDI only I thought), or the ST-speaker (phew!). A very handy utility for any fellow guitarists! Now I just need to convince the author to write a tablature utility! :) (Heck, I've got a break coming up, I might try and write one in Pascal or something ;-)

I found it in the new files listing on micros.hensa.ac.uk (accessed via WWW), but I also noticed a copy on ftp.uni.kl.de in pub/atari/incoming/

Erm, typically I've deleted the archive, but it was called "GUITREF.LZH" on hensa....

I also found, on ftp.uni-kl.de in pub/atari/incoming, a couple of games.

Firstly, "STario World", supposedly a "highly acclaimed" platform game. Highly acclaimed by whom I might ask... I wasn't impressed. It's unashamedly a Mario World rip-off, (and is intended as such), but the sprites are tiny, I'd say maybe 12*12 pixels, the animation and graphics are pretty mediocre, and I'd be surprised if even all 16 colors were being used, much less anything like the amount the far superior platform game "Fire and Ice" used (but hey, that was written by Andrew Braybrook, what do you expect other than perfection!?). The control was a bit too fiddly. They claim it's supposed to show the world that the ST can keep up with teh consoles. They obviously haven't seen "Great Giana Sisters" - which is what Nintendo swiped the idea for Mario World in the first place from, the game is virtually identical, which just some of the sprites altered. Great Giana Sisters is a LOT better than STario World, and was written several years ago for the ST and even I remember the Commodore-64. How this company can write a game this un-impressive and then want to charge 20 pounds for it, I've got to wonder. I know, these days we should be thankful for _anything_ for our 68000 machines, but still, I don't think a bit more work would go amiss..... This game doesn't seem to have been written in STOS, but you'd think so - although some of the local guys have written stuff in STOS that rival some of the top SW and even commercial games.

Roller-Coaster. Another SW-type game, this one _is_ written in STOS, and it shows by the slowness of the game. However, the principle of the game itself isn't too bad, sort of a cross between Pipemania and Logical you have to build a track using given pieces in the time limit that will

enable a ball to get from point A to point B. Any holes or misplaced pieces result in the ball falling to oblivion, or some such place. This one was tricky to get working, as it kept reporting "Error #48" upon loading it. Having a look at the program with MemFile v3.1, showed that the compiler they used was v1.0, which I'm pretty sure is an old version, so I assumed the problem was a typical STOS incompatibility, but from what I could make out of the Deutsch instructions it had been patched with STOS-FIX v2.2. So, out came the STOS manual (anyone want to buy a full version of STOS with box & all?), and error #48 was a "File not found" error. So, I just copied the contents of the folder into the root directory on a blank disk, assuming they must have used some wierd method of choosing the path to load from, and it started working. Not a bad little puzzle game, but a bit sluggish and jerky. The final version is supposed to have 100 levels which should keep people busy for a while, but it's a bit bland, some nice background music might make things nicer.

What else.... The shareware version of GSZRZ v5.5 (German). Apparently works properly under Magic and MTOS etc. now. 35DM to buy the full thing, and as the demo version only allows a maximum filesize of 80Kb to be transferred, it's virtually useless. And it pops up with a "Please register" alert every time you run it, rendering auto-recieve functions of most comms programs useless as well. More crippleware than shareware. However, if you want serious Z-Modem data transferring, it's about the only really good package that works with pretty much everything.

Cookie-Monster, a program that just examines the cookie jar of your TOS 1.4 or newer machine and tells you about everything that's installed.

Despite my surprise at finding something I could use, it looks like, for purposes of getting new and entertaining tidbits, my STe is pretty much had it, assuming I want anything of usable quality that is. However, as it makes a reasonably good terminal machine, I'll keep it until I can afford a power-mac (Or do I get a CBR-600RR first? :) If only the serial port would work at 57600baud on this thing....

Well, I've put the kiss of death on things, anyone found anything interesting lately that _isn't_ terrible? ;-)

*** SORRY ***

I know it's awfully rude to barge in like this, but this is a one-time only offer.

I had an Atari up until a year ago (yeah, yeah, traitor etc etc). Anyway, I had an interest in 68000 coding... and I did some stuff...

One program is a (fairly) flexible RAM-DISK with a CLI...
I also produced extensive tutorial docs for demo coding, including how to get full-screen, and how to scroll the *entire* screen (4 colour planes, 32000 bytes) in 1/50th of a second... very fast scrolling messages (ancient, I know, but the technique is worth knowing)...

If anyone wants the demo tutorial or any of the PD programs that I wrote (there was some fAirly useful stuff...), then E-MAIL me on: INGRAMJD@vax.sbu.ac.uk and I'll let you know how to get it (it's free, of course).

Ignore the EMAIL address at the top of this doc, I'm using a MAC and they always assign a different address for every post!

If I get enough interest, I may upload the stuff somewhere...

James

I've got a mint condition supra HD adaptor and PSU for sale or trade.
I bought it cheap with a 30 meg drive, but the drive is dead. The
unit itself doesn't look like it's ever been used, no dust on the fan
etc.

You could easily throw in an ICD host or anything you were inclined
to do. Includes the nice metal case and everything. Room for two
drives if you like to drill holes. (=

Looking to trade for a DEKA box or sell for whatever. I dunno what
it's worth.

IMHO, if it's good software, it's never a total waste: I still use Mastertracks Pro ver 3.6; it's old, no longer supported, etc., but it's a really nice program to use, very stable, and I can be a musician, not a techie/nerd. For video sequencing, I use CyberPaint; also ancient, by software standards, but I have yet to utilize all its many features, and I am frequently amazed by semi-accidental developments.

You're right, but the actual action has been done by a vdisys() call
after the pokes. The pokes only fill in the input arrays of the
corresponding VDI call, which is finally done by vdisys().

> POKE CN,3:POKE CN+2,0:POKE CN+6,0:VDISYS(1):POKE CN,14:POKE CN+6,4

>

Both examples show, what I meant : You have some pokes to provide
parameters, and the VDISYS(1) call at the end of the line. This probably
has been done because ST-BASIC doesn't provide bindings for all the VDI
routines. The COLOR command is also a VDI call, but this was easier to
call (just the "COLOR" command). In the other examples were TEXT
commands, also just a VDI routine. The calls before those probably set
the text parameters (i.e. font, attributes, size etc.)

I suggest you grab a VDI documentation with all routines described with
their corresponding input array settings. The arrays are : ptsin, ptsout,
adrin, adrout, control.

v3.0

> Will it run on a TT?

According to the manual:
"The spectre now works just fine - and very, _very_ quickly - with the
68030 processor, on the Gadgets 68030 SST and on the Atari TT computer."

It also supports a 68881/68882 chip if you have one installed for FPU stuff.

150ns? You'd be lucky to find any that slow! I originally had 120ns SIMMs
in my STe, and I've got 90ns ones in it now. This is only because they
were free. SIMM speed makes bugger all difference in an 8Mhz machine,
although you might notice some difference between 150ns and 90ns! The
STe will apparently only manage to keep up with about 90ns, or
thereabout, you really need one of the 68030 machines to make 80-60ns
SIMMs worth bothering with. Speed improvement is minor, but the cost of
ultra-fast compared with average speed SIMMs can be quite different
(About $20 per meg difference from 90ns to 60ns SIMMs)

: If so you should get a temporary IP-number. You will see that
: when or after logging in by consulting the STIK accessory.

I have to point out that having a temporary IP address has nothing to
do with SLIP or PPP. I have a SLIP account, and I have a static IP
address (I pay $10/month extra for that). I have a corperate PPP account
for our companies web server, which has a dynamic PPP address (which
means it changes each time).

Some last forever. Others get the "sticky head syndrom" Al la Seagate,
and the heads stick to the disk and rip the coating off. If you don't
shut it down, it will last a LONG time. But sometimes you'll shut the
thing down and it won't start up again. The Cure? Move the head stepper
motor by hand (yeeagh!). Then the drive will run properly, but you may
get some bad secotors and need to reformat, BTW. This only applies to the
1/2 height Miniscribe drives (mainly the 20 meg). The full height devices
seem more durble.

I am having problems with CAB I always getting this message can someone help?

Runtime error 163 at offset $000368c8

The memory location is always the same. Sometimes CAB works fine for an hour then this happens or it starts righta away. I do not have problems with other programs. Since it shows a runtime error does anyone know what CAB was wrote in (basic or what)?

BTW: I am using a TT with 10 megs of ST memory so I am not running out of memory.

Please answer by e-mail as my newsserver is unreliable.

HT> does anyone know of another recoverable trashcan that doesn't
HT> suffer from problems

Personally, I have found recoverable trashcans overrated. The one I
think you are referring to works the hard drive pretty hard, because
it writes a whole new file every time you delete one, slowing the
system and using up hd space. And then you use your own time
"housekeeping", dumping the trash frequently so the drive doesn't
fill up and over-write a boot sector :(. And in the time I used it,
I don't recall ever going back to the trash to recover a file.
Maybe Neodesk or others do it better, without the hassle.
On those infrequent occasions where it would be handy, Undelete (or
ST Tools) works fine.

Message-ID: <48l8k6$kbl@canton.charm.net>
Source record: 155953

I just bought the ICD AdSCSI+ HD controller used from a friend. Unfortunately he wasn't as into his ST as I am and only had the 1990 versions of the ICD software. Does ICD have an email address, w3 site, or FTP site that has the latest software?

Also, does the ICD driver now work with Minix partitions? If not, is there a way around this? I'm planning to install MiNTnet on a 130mb HD with two partitions (hopefully!) and would hate to corrupt the disk. Any help is appreciated!

Source record: 156024
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all--
I've got a Falcon, and I'm trying to get NOS to work with a 28.8 Kbps modem.

In my auto folder I have FPATCH1, FPATCH2, DRVIN, and SCC. And I have trashed the Atari supplied modem CPX.

The fastest speed NOS will accept is 19200, so even with my new modem, I'm only getting about 1600 cps throughput, the same as my old 14.4 modem.

I thought I read here that someone else had gotten NOS to work at high speeds, or was I mistaken?

Can someone PLEASE help me out? I will be eternally grateful.

Message-ID: <199511180024.AA00994@moroder.demon.co.uk>
Source record: 156025

The December issue of ST Format has 76 pages, 8 fewer than the previous months' editions. Have they dropped the price accordingly? No chance - it's still the same outrageous #4.25. I was the laughing stock of the office when I came back in with it after lunch.

The only thing which might possibly keep me reading it is an almost ghoulish fascination with its rapid decline. I mean, who really has the slightest interest in using their ST to create a comic strip? Maybe it might just about have been acceptable as a small feature, but devoting the front cover and nine full pages to this unlikely idea is obviously a cry for help. And just to rub salt into the wound, the article made repeated references to pop-artist Roy "Litchenstein". Ye gods.

Freedom and Thing might, but the standard Atari file system (for the half
dozen or so people that use it), won't, the only solution is to try and
run Minix or some such thing, or, just well Windoze to write it to a DOS
disk, rather than a Windoze 95 disk - it treats them differently. Good
ole' microsoft eh, laying down their standards as _the_ standard.... Ya
gotta hate 'em!

English Junior Office v3 is out there but the version has 1 or 2 bugs
in it. I have corrected these bugs (because I introduced them).

The working version should start appearing on the usual BBS's and FTP
sites within the next couple of days. Look for filename:

JROFF_3E.ZIP and a file date newer than now.

2232. MagiC and ICD SCSI->zip drive help, plse !

Newsgroup: comp.sys.atari.st
Date: 1995-11-18 00:00:00 UTC
From: vikki@sappho.ka4ybr.atlanta.com
Message-ID: <48jg1o$31e@wa4mei.radio.org>
Source record: 156034

Hi Y'all !

Got my 4 Meg RAM expansion into the 520ST and it is working fine !
Problem with MMU socket and chip, but a map pin and solder probe got
that worked out (took until 0330 last night, but it got done !).

Current problem is getting he Zip drive to work. I can access it, but
nothing seems to hold. Intermitantantly I get a TOS error -10 when I
run the ICD initilize.prg(? not sure of exact name, not at that
machine).

If I try any of the utilites, some work sometimes, and sometimes I am
told I need {something 5.5.2(?) or greater and what I have (I think,
that machine is upstairs) 5.5.6(?), whatever it is, What I have is
greater than what they says is needed. I've been running bill gates
crap too long, my brain is rusty :-).

I tried copying stuff to it and the files are corrupted and
undeleteable :-(. I suspect that it has to do with settings for the
driver ?! So far I haven't had any luck getting the system to boot the
zip drive, but I *suspect* that this has to do with the fact that it
probably wants to boot off SCSI ID 0 and the zip can only be set to 5 or
6 (without internal hacking, maybe). Would really like to get this
online. I called ICD today and thier tech support hours are from
10-1400 daily. I left a message so, hopefully I'll hear from them on
monday.

Any suggestions from anyone with success with the zip drives would be
appreciated, its kind of maddening to be this close and yet so far :-).

Also would like to be able to install Magic (got version 2.0x from Toad
yesterday, got lots to learn there :-). on the HD, but data seems to get
corrupted when I try.

Thanks !

Take care, Vikki.

YO! Rod .....

Dave S. here, down Medford way! Been awhile! Us diehard ATARIans often get strapped for cash to take care of major investments like the NET, but this one finally made it back up again. Still running a Unix-text interface, though.

The best local deal I could find is - yes, right here! - and they don't support SLIP, so I cannot even enjoy the the Bugs of CAB/STik (which appears to be the only GUI available for us.

Anyway, regarding the subject of print drivers - I have a STylus (grin) 800 that only seems to perform under pagestream using the LQ2500 driver or through STWriter for a direct link with text only.

I no longer have an INSTALL program, but that is a small shortcoming since they are everywhere. The thing I need to know is if INSTALL.PRG any driver in place of the TOS cludge or are these drivers program-specific like the DEGAS PRTs? I would like to put something in the background that will use a generic driver to do the desktop scndmps and what have you! Maybe even work across platforms where possible, etc.

And what else is new!

: should be public domain, and widely available.

: Greetings,
: TH

...(AND Rod Replied)...And I think YOU should wait a couple of months
after the printer is introduced before you start complaining about no
software drivers for it... Give developers a chance to find out what the
printer needs and surely as you are an Atari Die Hard, someone will come
up with a driver for it. Generally Calamus and PageStream are the
earliest to have drivers written for, so it depends on what software you
run. Contact your software developer and see if they are working on a
printer driver for their product. If you expect to have SpeedoGDOS print
out with this printer, then contact COMPO, etc.

FS: E-Magic LOGIC 2.0/NOTATOR 3.2/SOUNDSURFER 1.2 for Atari ST $250

CONTACT: jerbil@gramercy.ios.com ** Please reply via E-Mail **
Mastercard/VISA accepted

****
**** Logic 2.0 for the Atari ****
****
Powerful sequencing and notational software for the ST in its latest version.
- Object oriented (ie nice graphic interface of all functions.
incl. Piano roll editing
Event list editing
Notational editing
- "Hyper" editing of Continuous Controllers, PB, and Aftertouch
- Tape recorder transport screen with tracks for recording (incl. looping,
punch)
- Complete ENVIRONMENT PAGE for putting LOGIC in complete sync with your rig.
- Added "environmental" features like Arpeggiation, Midi Delay, etc.
- Synchronization includes Midi Time Code (MTC), SMPTE, and Tape Control
Mode (TCM)
- A "Transformer" for sophisticated GLOBAL edits and changes.
- Drum Mapping
- 99 Screen Sets allowing fast recall of your own window arrangements
(Very cool!)
- All original manuals, disks, and copy-protection dongle (LOG3) in
perfect condition.

****
**** Notator SL 3.2 for the Atari ****
****
- The program that came before LOGIC.
- Many powerful sequencing and notational features of its own.
- Includes SOFT LINK where several programs can be "multi-tasked".
- Real fast "TRANSCRIPTION" and editing.

****
**** Soundsurfer 1.2 ****
****
Universal Patch Librarian
- Supports most synths from major manufacturers.
- Recognizes MIDI routing for setup "scanning"
- Has UNIVERSAL MODULE for creating "adaptions" of your own
(Must use a key disk to run as I lost the authorization
due to a hard drive failure.)

> You will need to use disks formatted on a PC as 720kb and then they can be
> used by your Mac - Why? Because the Mac's system 7.5 PC-Exchange program
> will only let you format PC disks as 1.44meg disks which your Atari STe
> can't read without extra hardware (i.e. a 1.44meg floppy mechanism and
> a HD disk controller).

My PPC Mac running 7.5.1 could format disks at DD (720 Kb), and I've
used it to exchange GIF images and other files with my 1040 ST. No extra
programs or devices were required. Perhaps early versions of 7.5 lacked
the ability to format at both DD and HD, but not now.

Me too! I know it's available on Hensa, but where????? Can anyone tell
us where at hensa it's available (it's pretty hard to search for a
particular file there without knowing it's exact location).

Also, does anyone know where the fax driver that works with US
Robotics "Sportster" modems is? There's supposed to be one around.

>CAB was wrote in (basic or what)?

Cab was written in Pascal, but the part that causes the error is most likely STiK which was written in C. I don't know what the error is caused by, but once I do I'll do my best to fix it. Until then I'll do my best to find what the problem is.

Does anyone know, when the STiK/CAB will support PPP connection.
Here in Denmark this package is vertually unusable, since the only connections supported are PPP connections. I've also heard that PPP is a lot faster compared to SLiP.

Yes, but the last published set of accounts showed that atari had
$80m in the bank and net assets of $65m. Add to that the annual
contribution from Sega, and you'll see they are far from being skint.

As for C= when they went bankrupt they had $7m (worldwide!) in the
bank, were in default on various loans and had a net DEBT of around
$100m.

Source record: 156049

I have the MCA key that I found here. If someone would like to explain
how to send it back. I'd be more than happy to do so. I'd imagine
that I have to UUencode it. I'll attempt to do so. In the mean time
if you're looking for a good term program try to dl Teddy Term (tterm)
from one of the ftp sites. Actually, a better program but in a different way.
Emulates vt-102 (as opposed to ANSI), doesn't hang up when trying to do an
extended ascii send or enter a long ftp directory, and it uses the same
xfer ttp as FZDT--xyz. It does however lack a scroll back buffer and
requires you to call external text editor etc...
It's a much smaller program, though, which is beneficial to those who are
running under 2M. It served me well for a couple of years and is still the
program that I use when interacting with local BBS's.

I have the AT-Speed in my Mega4 and have never gotten the serial port to work properly either. It doesn't hang though, I just an extra character (a double) when I try and use a modem with it. There is an update (still 2-3 years old) to the AT-Speed software available from Compo that may/may not help your problem. Please email me if you get more info - good luck!

I've just had the dreaded 026 error after receiving an e-mail which
had a 700k uuencoded file in it. Oasis then crashed every time I tried
to access that mail box.

I took the file ed.txt in the oasis\spool\mail folder and removed the
uuencoded lines and after this Oasis indexed the mail without any
problem.

Is there perhaps some limitation within oasis as to how large an
e-mail file can be?

:
: NiCK
You'd have to buy the TOS 2.06 ROMS, and a board called TAB (TOS adapter
Board) that lets you use the 256K ROMS of TOS 2.06 in a non MEGA STE machine.

The board is around $59 and the TOS 2.06 ROMS are another $59. You can
install them yourself, if you think your competent enough, or have a
service technicial do it, and will probably cost you another $40.

Eric

Pretty much everything these days needs System 7, which Spectre can't run.
Or, it needs more than 4meg, which Spectre doesn't support, or it needs a
256 color mode, which Spectre doesn't support. Basically the only things
that will run reliably are those written prior to 1990. Of course there
are a few exceptions obviously, some authors go out of their way to make
their stuff work on pretty much all systems, but the good stuff needs a
real mac, (i.e, a machine with at least a 68030, 256 color support (or
better) and System 7.1 (or better).) It's a fun gadget (no pun intended)
to play with, (I've got one myself), but other than for things such as
your reasonably standard operations, the Spectre won't cut it.

The multitasking of System 6 uses "Multifinder" which doesn't work in quite
the same way as the multitasking of System 7, and is rather prone to
crashing, but as logn as you don't confuse it, works quite well.
Although, under the emulation, the processor time available doesn't
really make it worthwhile, as soon as you switch from Z-Term downloading
at 14400 baud, it starts getting errors because it can't keep up with the
data flow.

I use FPATCH2 with HSMODEM6 (DRVIN and SCC) and set up the baud rate in the CPX at 150, as well as on the NOS scripts. HSMODEM uses this slot and actually runs at the full 115,000 bits per second (with compression et all). It works fine on my Falcon with the Accura 28.8k modem.

Check out demon.support.ip.atari where the Oasis tech heads hang out if you have any other problems.

I am one of the few people who have had what I think your problem is. I couldn't get the modem to dial until I edited dial.txt, changed the init string to ATDTnnnnnnnnn (n being the number of the service provider) and removed the reference to the dial string. As a result the modem doesn't initlise with an ATDT but dials ok.

```
#
# Sample dialer script for login to Demon Internet Services
#
# replace 'site' and 'password' with your values
#
configure:
init "ATDT3854848\r"
dial_cmd "ATDT"
ld_code ""
number "3859666\r"
retries 999
#
execute:
init
cwait 25000 "CONNECT" "BUSY" "NO CARRIER"
cwait 30000 "gin:" "NO CARRIER"
wait 1000
send "*********\r"
wait 60000 "word:"
wait 1000
send "*********\r"
wait 60000 "ocol:"
wait 1000
```

```
send "ppp mru=1500 idle=300\r"
wait 60000 "HELLO"

# end of example
```

Hope this helps.

It doesn't need to be for Atari. The LaTeX2e macros can be compiled
with your TeX. You can get them from a ctan site.

I haven't got to it yet, though (HD full :-( ). I heard rumours that
you'll need BigTeX for it.

2262. need TOS 2.06 help

Newsgroup: comp.sys.atari.st
Date: 1995-11-19 00:00:00 UTC
From: eretic@tiac.net
Message-ID: <48nfbb$anp@sundog.tiac.net>
Source record: 155967

I have TOS 2.06 now that I have a Gemulator 4.0, I was going to run the program that comes with STonX to dump the ROMS right out of Gemulator, then it occured to me that the .img might be messed up, as Darek does some kind of patching to the ROM copy to make the OS work with Gemulator, and I don't know what the TOS dumper program is looking at when it's dumping the IMG, is it the real ROMS on the card, or the modified pseudo ROMS that Gemulator copies to memory on boot-up.

I don't know how to prove that I own TOS 2.06 (I also have TOS 1.0 on the card for compatibility with older games), but I would like to have someone send me the image, I could even run through my ST collection and publicly state what programs work on Gemulator and what works on STonx, and that will make it easier for people to decide if they want to pay the $$ for Gemulator, or go through the trouble of installing and learning Linux for STonX.

my Email is eretic@sunspot.tiac.net, and I welcome any comments from interested parties. As I'm excited about this, and I'm preparing to backup my system for the time some kind soul goes and sends me the images.

Ta ta

TH> actually works?

My family and I use ReSync for this. I got it from an ST Format
cover disk sometime in 1993, I think. It is a Desk Accessory - might
not work for what you want. I was also advised that Boot50HZ(?)
works, but never tried it.

Good luck!

enagel@ams-co.bru-ro.dhl.com wrote:

: does the Mega STE SCSI adapter need parity or not? And how do I tell if
: my Mega STE has a SCSI adapter (2nd hand so I don't know if it has one).

The internal interface in the MegaSTe is not able to handle parity at
all, you got to turn off parity on your harddrive. To check if you have
an internal interface, turn your MegaSTe upside down and remove the big
screw under the harddrive case. Now you can open up the MegaSTe's
harddrive case on the right side by pushing in and up in the front (where
the harddrive diod is). If you do have an interface it should be to the
right back of the MegaSTe. If you don't, bad luck, get a Link or similiar.

: Does anyone know if the Mega STE with internal SCSI can work with a
: Quantom Prodrive 80S?

That should be no problem at all as long as the harddrive parity is
turned off, and the harddrive is a standard SCSI drive.

I use Oasis with the Falcon, originally I had it running on an ST. I transferred the whole lot to the Falcon, upped the modem speed to 19,200 without any trouble and just left everything else as was. I first ran the system just using Fpatch2 and have since included hsmodem6 in the boot up. It works fine (apart from a block cursor which seems to flash on/off & sometimes leaves a trail at the end of lines when scrolling through news items).

> Is it possible to format a high density disc on an STF and have more
> than 720KB available on one disc?

You need a High Density disk drive for that, as well as the
electronics associated with it to read/write/format HD disks.

yes, you can store more than 720K on DD disks with certain formatters
that cram more space into them by using special formats- though this
will make them incompatible if you want to be able to read them on
MSDOS machines later.
I always format mine using MSDOS format options so they'll be
compatible with other machines, but that's your choice.
Incidently- the desktop formatter isn't fully MSDOS compatible even
though it claims to be- just try it and see.

Here's the one I use all the time. Never causes any problems. Run it
once, it switches to the other mode, run it again, it switches back to
the original.

94-byte (small enough?) file, UUEncoded using ESS-Code v6.4:

---cut here---

[Inline uuencoded payload not displayed: 50HZ60HZ.PRG]

---cut here---

How's that for a small UUE? :)

Hmmmm, looks like I was wrong about it being the other way around! :)

Oh well, GGS was released for the ST, whereas anything with Mario in it
ever was, so I'm quite content with GGS for the moment! :) (Hmmm, I
haven't played that in ages, might be time to boot it up once more...
yep, I didn't sell it with the other computer, phew :)

Cannot remember where you can find it, but you can enable
cheat mode by typing 'sara' as the word from the manual.
(dont worry, it will ask you another word, to prevent
pirates...)

Pressing '*' (IIRC) lets you edit the character data...
I'm afraid I cannot remember what values to change to
get the cloaking device... its hex numbers, so
fiddle and see...

You can get re-authorisations from EMAGIC.

SoundSurfer / SoundDiver is now at version 1.5. You can get updates from
ftp.mcc.ac.uk pub/emagic/SOUNDSURFER

Every Atari program has a header which contains flags which say "load me into FastRAM" and "make my Mallocs come from FastRAM". You probably don't have these flags set on your programs. This isn't a huge problem - just run something like GD-FLAG or FILEINFO.CPX and they will both let you change the flags. If you can't find either of those, email me.

Victoria Welch (vikki@sappho.ka4ybr.atlanta.com) wrote:
: I can partition it and format it, but it seems that I can't write on
: it, writes fail according to the message I get from the ICD software.

The problem is that the thing actually is write-protected. There is
a SCSI command to remove the write lock, but I haven't seen any
documentation for it yet.

: Absolutely no luck in getting the thing to boot off the HD. I am
: wondering if this has something to do with ID 0 expected to be the boot
: drive, but unfortunately the Zip drive only has ID5 and ID6 available.

If you can't write anything to the drive, you also cannot boot from it.
This is just a symptom of the above.

: I know people have these working out there, what could I be doing
: wrong here. BTW, the drive works just fine under DOS/windoz on the
: notebook with the Bus Toaster SCSI interface (A1520 compatible, I think)

Yeah, because their SCSI drive knows about that special command.

OK : To upload :

Logon to an ftp server as usual (see below for list).
(I don't know what system you are using so I can't be more specific; however
you can't upload through cab or something).
use cd etc. to move into a directory called uploads or incoming or
incoming_new.
enter "type binary"
enter "put <nameofprogram>"

You should also add small piece of text called "<nameofprogram>.upl" in the
same directory which is a brief description of the upload with your e-mail
address on.

There should be a readme called something like read.me_uploaders in most ftp
sites. Read this for specific information.

ftp sites :

ftp://ftp.funet.fi/pub/atari/
ftp://ftp.uni-paderborn.de/atari/
ftp://ftp.cnam.fr/
ftp://micros.hensa.ac.uk/ (This one is from memory, so might not work).

They all feed off each other, so it will eventually appear on most ftp sites
(especially if you put it in uni-paderborn).

Remember to suggest a suitable directory.

|> Sorry; no idea... That's a good question for some people, though.

First, CAF runs with FX without any problems. Because of some unknown reason (that made sense years ago like Douglas Adams described it...) CAF doesn't allocate FX-RAM for its samples. I've spoke with Steinberg, they said this 'feature' will be removed in the next update. The FX-RAM is capable of SCSI and sound DMA, and the Notator Logic Audio uses it without any problems...

Not specifically, but the standard LaTeX2e package will install just
fine. I use CS-TeX 4.0, and 2e runs beautifully on it. Once you've
downloaded the 2e distribution from tsx-11 or one of its mirrors, you
need to unpack the distribution files. Be prepared to wait a couple of
hours, and you may have to move files into the right directories. Other
than that, it's not hard at all.

Thanks for reminding me I have to upgrade to the lastest version :)

Last version was 3.2
Notator is no longer supported. If you want the updates for Notator, then
you should move to Logic, which is a much improved Notator, with many
changes (although some people still prefer the score features of SL).

> IMHO, if it's good software, it's never a total waste: I still use

Definitely. There's a lot of snobbery in the software world that says
there must be new versions of everything. It it works, use it. SL is
still a very good program, not as powerful now as Logic, but very fast on
a standard Atari.

Yes, you need a BigTeX. But it's possible to make a new format file.
I've done it a whie ago. I removed it because I don't have enough space
on my hard disk. I remember that there was a problem with starting IniTeX.
If you speak german, you can ask in de.comp.tex. There are some people
running LaTeX2e on an Atari with MultiTeX.

An ST can access RAM at 150ns in a 1Mb or less machine (using 256k SIMMs),
120ns in a 2Mb or 4Mb machine (using 1Mb SIMMs).

> \
>
Wrong also. I really think this sort of thing depends o which country
you are in. In a lot of cases, software comes in a nice envelope and
o the front it says that by opening the envelope (and hence using the
software) you agree to ALL licensing agreemets. As I say depends on
the agreement, company, and more importantly the country in which you
live/use the software.

For Example in Germany a souncard which has no eglish warnings, has
legally to have in german a warning about how using a joystick is
unreliable and may not work with certain processors. A warning which
doesn't exist in english.

An Alpha version of NetBSD 1.1 can be found at
<URL:ftp://ftp.netbsd.org/pub/NetBSD/arch/atari/>. If you're not in a
hurry, I suggest you just wait a few days for 1.1-RELEASE to appear.
It will be available at the same site in
/pub/NetBSD/NetBSD-1.1-RELEASE/atari.

It works best if you have the slowest simms first, if you have the faster
ones first it sometimes won't recognise the second 2 megs on bootup. Can
be nasty if you have a reasonable ram drive set.

2318. Goal on ST (TOS 1.0)?

Newsgroup: comp.sys.atari.st
Date: 1995-11-20 00:00:00 UTC
From: cczcole@unix.ccc.nottingham.ac.uk
Message-ID: <48q62m$8eg@griffin.ccc.nottingham.ac.uk>
Source record: 156001

I recently bought a 2nd-hand (at least) copy of Goal for the ST. The cost wasn't exactly bank-breaking so I was fairly open-minded about it. I then ran it up on my olde STM (TOS 1.0), and was a little dismayed to find myself having to save (eg. a league or cup competition) after every game as it crashed out/hung up so often - that is, in fact, if I even got that far! My question then, is Goal for the ST really *that* bug-ridden or does it run better on a more recent ST/TOS combo.?

Many thanks!
Marlon

Source record: 155853
Body handling: Inline uuencoded payload not displayed: FZDSTERM.KEY

FZDSTERM.KEY file - Registration key for the FreeZe Dried Terminal
v2.20 communications software for the Atari 680x0
series of computers. Standard ASCII UUEncode.

Someone recently posted this key, but it looks like their editor
tried wrapping some of the text, which although easily fixable (just
un-wrap it), might not be immediately obvious to everyone. So, here
is the "PD" (ahem, cough), key for FreeZe Dried Terminal v2.20 -
Apparently made by "Elite" of the "M.C.A". Standard UUEncoded file.

: Does it run with X Windows ?

It is possible to run the X Window System (what the hell is X Window_s_?), but currently only with 2 colors.

: Deos it require FPU like LiNUX does ?

The normal system you find does need a FPU. But there is currently one system running NetBSD without FPU. It uses a FPU emulator. If you need this system, write to: leo@ahwau.ahold.nl. Leo is the maintainer of the atari port.

Yes, it seems to dislike both TOS 4 and Geneva... But it works great
on an accelerated Falcon (FX card) with FastRAM. =-)

NVDI is pretty important here, too. The game isn't the fastest in the
world otherwise...

>
>Does e.g. Laserjet IV -driver of NVDI or Calamus SL work with
>their 600 DPI mode? What happens if I try to print in color
>using DJ 550 driver..?

I bought an HP660C a few weeks ago and drive it from my Falcon.
I haven't yet got it printing 600dpi colour, but if you send it ASCII
text it prints that at 600dpi.
I use the 550 option for NVDI, Imagecopy, and Papyrus and that
works just fine in colour and black and white.

>I really dislike the idea of waiting for months for some update,
>just for perhaps one printer driver. I think, updates like these
>should be public domain, and widely available.

I know what you mean, but it works just as well as an older HP
model for the moment (a little better in fact because the ink is better),
and the decent apps are still being developed, so I'm sure the 660C will
be catered for soon.

HT>But WHERE on Hensa??? It's virtually impossible to find anything there
HT>unless you know the exact directory.

p173 15/02/95 S--- JUNIOR OFFICE Shareware FAX program (G)
^^^^
-----------------------------------------------------
ACCESSING THE PACKAGE
---------------------
If you're accessing the files from a terminal, you'll need to change directory
to the sub-directory concerned. For example, if you want the package with
prefix "z101", you'd do

cd micros/atari/tos/z/z101

(assuming you're in the top level directory). [Note the "z" sub-directory which
is derived from the first letter of the prefix.]

Access by FTP is similar: here you always need to give a full pathname for the
files you want, so the files in this example would be

micros/atari/tos/z/z101/...

Within each directory is a file called "00contents" (the first two digits are
zeros), which gives a list of all the other filenames in the directory. Thus,
if you are using FTP, it's best to pull this first to see what's there. So
that, in this example, you'ld start by pulling

micros/atari/tos/z/z101/00contents

RTFM ;-)

Get the INDEX...

Sorry I hadn't include the previous(long) posting but I have to add a few
things to the subject.

I do agree that ST Format is not as good as it was a few years ago. When
I started out using my ST, there was only one place that still supported
the Atari's(Now it's all PC except for Atari magazines). And every
chance I get I go down to that store and buy a latest STF. Back then,
you had lots of stuff. Lots of cool games and plenty of useful applications.
And the captions...pure primal laughter :) The magazine was at it's best
when Paula Richards was the editor, she made it into the world's best ST
magazine. But things started declining IMHO when Trevor took over and
now Karen. You can't totally blame them though because the ST world was
changing. ST games are no longer coming out, Europe is starting to
become PC-oriented like the States, and all the other ST magazines went
out. In fact, STF merged with ST Review and changed their look. It's
still useful but not as cool as it used to be. Oh well...

I am looking for some programs or for someone who could write them,
I am looking for 1st, a Garden info/design program with a database of
plants with their names and growing areas/zones.

2nd. I'm looking for a program that would have a list of parts used in
the building of Model Rockets and would have a way to display what a
design would look like using parts from the list, also be able to
figure it's CD and other data to figure how high it would go using
engines.

I've seen the likes of these on beemers, I want them for my Mega ST4.

I have the following for sale

1 Atari 1040ST-F computer
This is a full Atari computer with a 3.5 inch drive. The keyboard
and
computer are integrated into one case. It has 2 joystick ports, a
mouse port, modem port, printer port, hard disk port, floppy disk
port, 2 midi ports, and an extention port (no idea what it's for)
This is in great condition.
I suggest that whoever buys this also buys the SM124 monitor. they
go
well together.

1 Atari SM-124 monitor. I have NO specs on this monitor. I'm not
even
sure if it's color. I made sure it works, but the screen I brought
up
was black and white. It is in perfect working order, and great
condition

4 ATARI 520ST computers
This is a full Atari computer with a 3.5 inch drive. The keyboard
and
computer are integrated into one case. It has 2 joystick ports, a
mouse port, modem port, printer port, hard disk port, floppy disk
port, 2 midi ports, and an extention port (no idea what it's for)
These will hook to a standard TV set. They are in great condition.
They do need a power cord.

If you are interested in any of these, please email
princess@midtown.net

In article <48d84e$aq4@dub-news-svc-6.compuserve.com>, <100720.1232@compuserve.com>
writes:

> Can any one tell me if it possible to access CIS with my old atari at home?

> I have just got a free trial through the work's PC so I'm a definite newbie!

Yes. In fact there are two ways:

1. Use a generic comms program from the dozens available. Use VT52
emulation and set the magic doodahs to 7-N-1 (7 bits, no parity, 1
stop bit). The login sequence should look like
send a couple of carriage returns to get a prompt
send CIS, wait for User Id:
send user id, wait for Password:
send password
The awkward bit is: to download (or upload) a file you need to set
protocol to 8-E-1, and then switch it back again afterwards.

All the above from memory, no warranty given as to correctness or
fitness for use.

2. Download Jim Ness's QuickCIS program from the ATARIPRO forum.
QuickCIS automates mail sending and retrieval, downloads forum
messages and fetches files for you. It ain't WinCIM, but it beats
composing messages online ... problem, Jim has stopped maintaining
the program; he claims to have lost the source. :[That means
there are a couple of known problems which will probably never be
fixed.

Unfortunately CIS is evolving more and more in the direction of AOL,
so newer services (mainly internet-related) are designed to work in
collaboration with their Mac or PC software. They don't publish any
description of how these things work, they just offer libraries in
binary-only form; so it's not even possible for a keen volunteer to
knock up something for the ST. We're not the only ones to suffer;
the Unix forum is full of disgruntled Sun and SGI owners asking why
Compuserve seems not to want their business.

Source record: 155936

Hello.
My friened has a problem - he lost ROM in his Mega STe. The problem is, that it is (was :-) English version and in services in Poland they have only German TOSs. But there is a solution: download Eng. TOS 2.06 from English Mega STe. He has suitable software. So, the question is: is there anybody who can help him? I can send You downloading software and collect downloaded TOS via e-mail.

Banan.

2347. Atari-PC compatability: a naive query

Newsgroup: comp.sys.atari.st
Date: 1995-11-21 00:00:00 UTC
From: R.W.Allen@ecs.soton.ac.uk
Message-ID: <9916.199511211652@diana.ecs.soton.ac.uk>
Source record: 155937

Hello. Apologies for taking up bandwidth, but I have a brief query which I would be most grateful if anyone could answer.
My brother recently acquired an Atari ST. It's a bit old, and he's worried that the text files he has saved might be lost or useless if the machine fails. I promised to move Heaven and Earth to find out if such files could be stored/read in anyway on an IBM-style PC. If so, I could back the files up for him on my work PC.
So there's the query - can I use a DOS or Windows (or other PC package) to read Atari ST text files? Are the formats compatible?
Thanks for any help.

2351. Problem configuring MINT

Newsgroup: comp.sys.atari.st
Date: 1995-11-21 00:00:00 UTC
From: monclar@butler.cc.tut.fi
Message-ID: <48sajh$j9r@cc.tut.fi>
Source record: 155941

Hi everyone,

I have just downloaded mint (1.2.2) with toswin (1.4) and tcsh (6.033 or something like that). I installed it on my hard disk with enough space as required, etc. My problem is : When I open a tcsh window with TOSWIN, my environment variables ($HOME and $PATH) are not properly fixed...

I tried :

1- creating a \etc\login.csh with the setenv commands
2- puting these commands in the mint.cnf file

Nothing changed. So I have to manually set these variables each time I open a Tcsh window... then it seems to work.
Can somebody tell me what I did wrong (or didn't do at all) ? By the way, I didn't install minixfs, I don't know if is of any importance...

That's all, thanks in advance,

.fr (monclar@butler.cc.tut.fi)

2352. Zip _could_ be used as boot device

Newsgroup: comp.sys.atari.st
Date: 1995-11-21 00:00:00 UTC
From: buxmjp@zippy.dct.ac.uk
Message-ID: <1995Nov21.105345.22250@zippy.dct.ac.uk>
Source record: 155942

It occurs to me that a ZIP drive can be used as a boot device, if you change the SCSI ID using a bit of hardware. The scsi addresses the device can occupy are 110 and 111 (bin). To boot using most host adaptors, it needs 000. Either the whole scsi bus can have invertors added, inverting every devices ID, or the zip drive on its own could have the invertors in the scsi device ID section.

The first method is easiest, has less chance of problems with devices intefering with each other. The second way allows you to use an external drive on any scsi machine.

Either way, a few pounds of chips and connectors, for a neat solution, and a soldering iron. I should think anyone who understands the basics of binary and of digital electronics could run one up. Failing that, anyone in the UK want to pay me to make them ;)

2354. Gemulator 1.0 Question

Newsgroup: comp.sys.atari.st
Date: 1995-11-21 00:00:00 UTC
From: peterw@io.org
Message-ID: <48sqa6$68@ionews.io.org>
Source record: 155944

I recently dug out my old Gemulator Board with TOS 2.06 Installed and the early Gemulator software (1.0 I think) which works under DOS and decided to give it another try. Could somone be so kind as to tell me how to access the Hard Disk? I've tried booting with AHDI.PRG in the Autofolder. Gemulator boots fine when there is no AHDI in the autofolder, but just hangs without even starting when the prg is in the autofolder. I realize that only the first 32M of the hard disk can be accessed. Could this have something to do with Windows95 being installed? It shouldn't... as I've tried booting straight to DOS and it makes no difference.

I guess this is why I packed away my then $200 Gemulator and gave up ;-)

Anyhow, any suggestion would be greatly appreciated.

Thank's

peterw@io.org

2358. Problems with these Acc/auto prgs?

Newsgroup: comp.sys.atari.st
Date: 1995-11-21 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <30b23b02105b885@oslonett.no>
Source record: 155948

I'm trying to figure out what can be wrong with my system since it keeps freezing/bombing all the time.
It especially freezes when I'm in a text editor (I've tried several- 7up, Edith, Everest...).

I can be working on my email and all of a sudden the cursor stops moving and I can't access any menus any longer (but the mouse pointer moves), and other functions seem to work as well, like if I have the "fuji" program which rotates the Atari symbol in use- it still spins. Has anyone had similar problems?

I've tried to strip my system free of accessories and auto programs one by one, and it seems like the problem *can* lie within the use of the "Mauswindow" accessory (auto-window topper), but I'm really not sure.

Has anyone had any problems with any of the following?

"AUTO" programs:
----
automous.prg (Mouse pointer customizer)
ledpanel.prg (shows capslock on-off/read/write/time etc in menu)
n_althlp.prg (together with CPX- ALT-HELP to get a screenshot)
slectric.prg ("Selectric" file-selector)
trash.prg (together with CPX, recoverable trashcan)
compose.prg (together with CPX, for assigning alternative characters)
maccel3.prg (mouse accelerator)
fujidesk.prg (spins the Atari symbol at the top left corner)
fujiwatch.prg (same as above with a watch instead of "busy bee" pointer)
environ.prg (sets the environments- clipbrd/temp etc.)
mfp.prg (driver for "RSVE" high speed modem circuit)
drvin.prg (driver for "RSVE" high speed modem circuit)
hd_fdc.prg (changes step rate to 3ms- for TOS 2.06)
silkmous.prg (mouse accelerator/screensaver)
maxid_22.prg (reset proof RAMdisk)
ping.inf (system bell replacement- with CPX)

ACCessories:
----
chmeleon.acc ("Chameleon" Accessory loader/unloader)
edith.acc ("Edith" text editor)
callslct.acc ("call Selectric" file selector accessory)
mauswind.acc ("Mauswindow" automatic window topper)
xcontrol.acc (CPX accessory- for all CPX modules)
menuinfo.acc (shows time, memory usage, time, window in use etc.)

: > or one of the mirrors.

: Does it run with X Windows ?

It is possible to run the X Window System (what the hell is X Window_s_?), but
currently only with two colors.

: Deos it require FPU like LiNUX does ?

Normally the NetBSD system requires a FPU. But there is one system running on
a Falcon without FPU. The kernel for this system is compiled with a FPU emu-
lator. I don't know if you find this kernel at a ftp site. But you can ask
leo@ahwau.ahold.nl or at the netbsd mailing list of the atari port. Leo
is the maintainer of the atari port, he compiled this kernel.

[Author was Simon Chiu]
[Posted on 19 Nov 1995 19:47:54 -0800]

This sale will end soon, please mail me if you have any final bids...

My ATARI MEGA2 ST

Current offer is 280...

Of course, I am willing to trade for other stuff like toys I collect or
anime items, etc...
Stuff like Voltron, Macross, Gundam, Visionaries, any old japanese toys, etc..

Here's the run down:

Hardware:

Atari Mega ST2 Comes with Internal Floppy drive and mouse and keyboard
Atari SC1224 Monitor (color, old model, made in Japan the "better" one before
they started using the cheap parts one from Malaysia or something...)
Atari SF314 Floppy drive External
2 EPYX 500XJ Joysticks (very tough, uses a STEEL shaft)
All cables...

Software: (all are originals with docs and box unless otherwise noted)
(Condition of box and docs are usually Excellent too)
(a * means I have actually loaded this and made sure it
works)

1 Hex Mark of the Unicorn *
2 Death Sword EPYX *
3 Starglider Rainbird *
4 Questron II SSI *
5 Demon's Winter SSI *
6 Final Assault EPYX
7 Winter Games EPYX *
8 Wizard's Crown SSI *
9 Axe of Rage EPIX
10 California Games EPIX
11 Ninja Mission ST Programs
12 Sub Battle Simulator Masteronics EPYX
13 Battleship EPIX
14 Phantasie III SSI *
15 The Sentry (GOLD) Firebird
16 Golden Path Firebird

17 UMS (Universal Military Simulator) Rainbird
18 Knight Orc Rainbird
19 The Pawn Rainbird *
20 Tracker Rainbird
21 Jinxter Rainbird
22 The Guild of Thieves Rainbird
23 The Advanced OCP Art Studio Rainbird
24 Roadwar 2000 SSI *
25 Oblivion EPIX
26 Transylvania Polarware
27 Jewels of Darkness Firebird
28 Oo-Topos Polarware
29 Silicon Dreams Firebird
30 Space Station Oblivion EPYX

This sounds like what the Magic Shadow Archiver (MSA) does?
Should be available on atari.archive.

or

you could use one of the loadable file systems for MiNT in the 'RAW' mode,
where you can 'cat' the whole disk to a file.

Your friend is a sucker who got ripped off.

He can upgrade the RAM to 16 Meg. He can upgrade the Hard Disk to 1Gb
and I'm sure he can upgrade almost every other component on the system
including graphics sound and processor.

Fortunately this is very easy to do on a PC. This is VERY difficult
with an Atari.

> He's still paying for it, it's worth nothing and he can't use any
> recent PC software with it.

Bullshit. With a little money spent getting more RAM he will be able
to run 98% of all current DOS/Windows/ OS/2 software.

Would you like to be using a Falcon with only 2Mb RAM ??

> He is now sickened with the whole idea/cost of computers and is
> unlikely to ever replace it.

Well more fool him then.

I don't remeber which key I got but it was on an STF coverdisk and I
think it was the MCA key (which is as stated the Menacing Cracking
Alliance). This kinda means that STF are either in trouble, or hope
that no one is going to notice !!

In article <JEREMYB.95Nov22163506@ORAC.pec.co.nz> JeremyB@ORAC.pec.co.nz (Jeremy Bowen) writes:
|agoold@cix.compulink.co.uk ("Alasdair Goold") expounded:
|
|| while the reality is that the technology is changing so fast that
|| they WILL need to upgrade very soon. This is a fact and will
|| probably never change though. An example of this is a friend of mine
|| who 18 months ago bought, on credit, a 386 PC with a 50 Meg HDD and
|| 2 Meg RAM for very nearly £1000 from a well known High St store.
|
|Your friend is a sucker who got ripped off.
|
|He can upgrade the RAM to 16 Meg. He can upgrade the Hard Disk to 1Gb
|and I'm sure he can upgrade almost every other component on the system
|including graphics sound and processor.
|
|Fortunately this is very easy to do on a PC. This is VERY difficult
|with an Atari.

Well, one typically needs to upgrade much more often with
a PC. On an Atari it is more of a luxury. On a PC it is
a dire neccesity to keep up with bloatware...

Also, the upgrades you are suggesting are tantamount to buying
a completely new system in terms of cost. There really isnt
all that much to a PC motherboard... & you are really just
suggesting he replace everything else...

Nevermind none of this considers the extensibility of the old
system. Since there is no consistency with PC products, no
assumptions can be made.
|
|| He's still paying for it, it's worth nothing and he can't use any
|| recent PC software with it.
|
|Bullshit. With a little money spent getting more RAM he will be able
|to run 98% of all current DOS/Windows/ OS/2 software.

Yeah... but he'll fall asleep doing it!
The 386 just doesnt have the performance to adequately
peform while running current apps (or even games).

|
|Would you like to be using a Falcon with only 2Mb RAM ??

Unlike any current PC, a Falcon can actually run on 2Mb
and still have user response.

A Falcon will run a HELL of a lot better than any clone
on 2megs...
|
|| He is now sickened with the whole idea/cost of computers and is
|| unlikely to ever replace it.
|
|Well more fool him then.

Get him a subscription to Computer Shopper...

Going into a computer store ignorant is asking to get raped.

>prepare. Thanks...

An Atari Falocn could have done the same thing as your Dual Pentium
system (Audio, CD recording) for a fraction of the price. Since you have
the computing power to solve the American economic crisis, I wouldn't
bother with an Atari to be honest! :)

Regards,
Paul

>> Supported drives for the moment are Ricoh, Philips and JVC.
>> The price for the driver software will be: (here in Sweden)
>> CD-recorder Pro SKR2700 (approximately USD385)
>> CD-recorder Audio SKR1400 (approximately USD200)
OB>
OB> Does someone know whether it definitively works with a Falcon and one
OB> of the new Philips CDD2000 recorders?

Since SoundPool's catalog says that Philips recorders are supported, I suppose CDD2000 will work. I've recently sent a fax with this question but haven't had an answer yet. You could try contacting them yourself.

The price has been revised a little: PRO SKR2500 (USD357), AUDIO SKR1250 (USD179).

Thre's no show for Scotland that I've heard of, just Birmingham and London. You can EMail Atari World at atari_w_admin@cix.compulink.co.uk - WEB page in the offing... Details on back issues are in each mag, but the subscription details I post to the NeST support area are as follows:

==========
The /Atari World/ fair deal for subscribers
****

* We guarantee you more pages, more editorial, more advertising, more professional journalists and more copies printed per issue than any other English language Atari magazine - or you get a free issue of /Atari World/!

* We will get your copy of /Atari World/ winging its way to you before it appears in the shops. As a subscriber you will be one of the first to read each new issue of /Atari World/.

* When you take out a quarterly subscription we will charge you once a quarter, so no nasty shocks once a year. Alternatively, if you decide to subscribe annually, you get an issue of /Atari World/ free.

* When you subscribe you only commit yourself to one more issue. You can cancel your subscription at any time by contacting Specialist Magazines. We will arrange to cancel your Standing Order and, if appropriate, we will refund any outstanding subscription moneys directly to you.

So what does it cost?
****

Payment either by credit card or standing order (UK quarterly subs only). Annual subscriptions can also be paid for by a cheque drawn on a UK bank or building society.

UK Scandinavia EU Rest of the World

3 issues without disk £9.50 See special £11.50 £14.50
3 issues with disk(s) £14.00 Scandinavian £16.00 £19.00
13 issues without disk £38.00 prices below £46.00 £58.00
13 issues with disk(s) £56.00 £64.00 £76.00

Readers of /Atari World/ in Sweden, Denmark and Norway can subscribe via Sven Bornemark Musik. Scandinavian customers get an additional Swedish supplement free with each issue! Payment should be made in Swedish, Norwegian or Danish Kroner via Post Giro.

Sweden Norway Denmark Finland

3 issues without disk SEK140 NKK120 DKK110 FIM 85
3 issues with disk(s) SEK190 NKK160 DKK140 FIM 110

> Thanks for any help.

Sure, you can store data from an ST to a PC. ASCII files are no problem,
but as for formats such as 1st Word you may have to find converters. I
recommend The Ultimate Converter(TUC). Just remember that you need to
use a 720K floppy DOS formatted to use on both an ST and a PC. Of course
you may be able to find Ghostlink which lets you use PC drives as a
partition on the ST. Hope this helps.

2378. Help with Stalker downloads

Newsgroup: comp.sys.atari.st
Date: 1995-11-22 00:00:00 UTC
From: Eric Noss <enoss@planetx.bloomu.edu>
Message-ID: <Pine.SUN.3.91.951122101009.13425C-100000@planetx.bloomu.edu>
Source record: 155718

I have a problem with Stalker 3.4, even since I've had it I can never get any downloads without it timing out. I hardly ever had this problem with KM-Term using XYZ protocal. I've used Zmodem, Ymodem, and even Ymodem-G but it always gives out. I don't even use it except for small text files because I can FTP on my floppy using the lab computers. But I couldn't even DL a small text file from a BBS no matter what. It seems evertime I go on-line, something happens that infurates me :(

I've put a lot of effort into trying to get a decent Stalker setup. Here's what I have so far:

Hardware:

2400 modem

Software:

STalker 3.4
STeno 2
Control Panel (Not Xcontrol)
Selectric

I suppose that I should pick up a better modem but when I first used a 2400 modem a few years ago, I had no trouble. I was thinking of using XYZ again but I still don't know what the problem is. If anyone can help, I really thank you for it.

If this helps, I remember reading about Gemulator 3 in Current Notes.
The guy said to make a boot disk with Supra HD controller and CAUTO which
switches to the C drive to load the rest of the auto programs. You might
try it but I'm not sure if it may work on Gemulator 1.0

> I realize that only the first 32M of the hard disk can be
> accessed. Could this have something to do with Windows95 being
> installed? It shouldn't... as I've tried booting straight to DOS and it
> makes no difference.

That has to do with TOS not Windows95. TOS can only access up to 32Mb of
HD space, something that was corrected in Gemulator 95 I believe.

Of course, you can ask someone who actually has Gemulator as I'm saying
stuff from what I have read so far. It's a lot cheaper than buying a
product :)

^^^^^^^^^^^^^^^^^
This is news to me !!!
>"Sportster" modems as well?

Him,

Sorry to be the deliverer of bad news but JROFF_3E.ZIP still only
supports class 1 and 2 (not 2.0) however you can use your sportster
in Class 1 mode. I know cos' I got a 14K4 Sportster and JROFF_3E.ZIP.
```

The only Fax software that supports 2.0 AFAIUI is CoMa at Version what
ever, its forever changeing, but it'll cost you plenty (€50-€70)
with updates.

2385. M4NODMA.PRG for ATW800 wanted

Newsgroup: comp.sys.atari.st
Date: 1995-11-22 00:00:00 UTC
From: I.vanderMolen@PTT-telecom.nl
Message-ID: <I.vanderMolen.47.000F0D19@PTT-telecom.nl>
Source record: 155873

Hello,

Can anyone help me to get the M4nodma.prg for the atari ATW800 (formaly ABAQ) system? I have got M4idma.prg, but my SCSI disc is to fast, so the system crashes when using DMA access.

Please send reply's to:
I.vanderMolen@PTT-telecom.nl

>Has anyone had similar problems?

Funny problem you have. No, I've never had these problems.

>I've tried to strip my system free of accessories and auto programs
>one by one, and it seems like the problem *can* lie within the use of
>the "Mauswindow" accessory (auto-window topper), but I'm really not
>sure.

If you use MenuInfo you don't need MausWindow anymore 'cause MenuInfo
does the same. If you've enabled the widowtopper inside MenuInfo this maybe
a cause of your problems.

>Has anyone had any problems with any of the following?

The following ones run without any problems on my MegaSTE with MagiC3, the rest
I don't need:

>slectric.prg ("Selectric" file-selector)
>mfp.prg (driver for "RSVE" high speed modem circuit)
>drvin.prg (driver for "RSVE" high speed modem circuit)

>callslct.acc ("call Selectric" file selector accessory)

Why don't you use the CPX module? The you have one more accessory slot!

>menuinfo.acc (shows time, memory usage, time, window in use etc.)

BTW: You can call Selectric by clicking the LEDs and pressing left shift.
MenuInfo 2.42 is the current version (ftp.uni-paderborn.de/atari/tools/util)

2387. FS: Calligrapher GOLD - great Word Processing/ DTP Package

Newsgroup: comp.sys.atari.st
Date: 1995-11-22 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DIG9K8.K1s@freenet.carleton.ca>
Source record: 155875

I'm selling a complete copy of Calligrapher GOLD, as new, in the box
for Cdn$50 (US$45). This package includes the acclaimed Caligrapher
DTP software, plus a number of add ons (like bar code printers, fonts,
drawing /art editing toolls, spell checker modules, etc.).

The package runs on a 1meg ST with a mono monitor, or on a colour machine
with a bit more ram. You can't go wrong for 50 bucks!

Get a hold of MSA (Magic Shadow Archiver). It can compress and/or split whole disks into one or two files. You can get it from HENSA or UKUUG.

The German shareware program "Connect" can do all of that and more.
You can find it just about anywhere, and it's possible to use free for
30 hours. After that you have to register (it's worth it!).

Hi folks,

**********NOT SUITABLE FOR STE**********

A friend of mine, heavily into MIDI has been rummaging around
his bits and pieces cupboard, hunting for stuff to sell so that he can
finance a few Christmas aquisitions. So far he has only come up with
this one item. To whit: Autoswitch Overscan Board (complete, unused,
with software and manual) This board can increase the screen size
available (on STfm models only) by (promise the developers), as much
as 72per cent. According to the manual 384x240 pixels is possible on
SC224 monitors (colour) and 672x480 on the good old SM1224 monochrome.
The manual is detailed and comprehensive describing several
installations (STF - Mega ST). A maximum of 10 solder points are
necessary.
Nearest offer to 30UK beer vouchers I mean sterling contributions
to our capital, secures the device.
Bids to: eluag@leeds.ac.uk

RAM shouldn't be a problem. Seems like Either something set in the
drive, or the ICD software !

>
> Absolutely no luck in getting the thing to boot off the HD. I am
>wondering if this has something to do with ID 0 expected to be the boot

Zip drives cannot become boot drives for exactly the reason you just
stated, ID can only be 5 or 6 and the ST needs ID=0
>
> I've tried it terminated and unterminated - seems to make no
>difference.

Either the disk write protected (did you get any special CPXs with it
??) or the ICD software then !

>
>
Ok, relly depends on what you mean by a virtual drive. If you mean
the MSDOS way of doing it (creating a drive of which the root is a
folder in drive C:) then it isn't going to work. There was an
Atari ST prog to do this but it cheated and wrote out small programs,
whcih just ran another program.

Your best bet is to make a RAM disk (make sure its not too big, with
only 1 Meg of RAM), and stick stuff in there. You can have more than
one if you find the right RAM disk program. However note that stuff
will be wiped when you turn the computer off (some like eternal will
survive a warm reboot).

Any more questions ???

>A friend of mine wants to sell Spctre GCR with System 6. Is this a good
>idea?

If you're interested in buying it, don't bother. Practically nothing written after 1992 runs on a System 6 based Mac. If you are content to run MS Word 4.0, Excel 2.0, PageMaker 3.0, etc. then maybe the GCR is a good idea.

>I use a Mac with system 7 at CKDU-FM and like its multitaksing. Is
>System six limited in this?

System 6 uses Multifinder to accomplish its multitasking. It's stable and it works but it won't do you any good with modern software.

>Would I be limiting myself from new software
>development by using an older OS?

YES.

>Is older good software available or is it disappearing like 5.25" based programs
>fro IBM 286?

There is still some shareware out there that you could use.

If you've got money to spend, I suggest buying a Power Macintosh 7200/90. These can be had for $1900 with 90MHz PowerPC, 8MB RAM, 500MB hard disk, and 4x CD-ROM. The monitor will cost extra (or you can use a VGA monitor).

If you DON'T have money to spend, I suggest you buy a NEW Macintosh LC 475 or similar. This machine has a 68LC040 and will run all of the latest software at a decent speed. Best of all, a new LC 475 is running $499 with 4MB of ram and a 160MB hard disk.

Basically, if you don't have at least an 040 Mac, you're not going to be running much of anything.

Hello! I have the for following items for sale, shipping is additional:

MAC software and hardware:

Mactools PRO v4.0, LATEST version, complete with all disks and docs. $40

Quark XPress 3.1, non registerable, manuals, disks, box, etc. COMPLETE $100

PageMaker 4.0, manuals, disks, box, etc. use for cheap upgrade- COMPLETE $100

WriteNow 3.0 new condition, all disks, manuals, box included. $25

Adobe ILLUSTRATOR 5.5 upgrade disks only, no manual $50

Backmatic 2.0 highly rated automatic backup utility $10

Aldus Freehand 1.0- use for cheap upgrade! $25

Iron Helix CD game, great!, complete with disk and manual $25

Serial cable for Mac. $5 includes shipping

Intermail/ Microsoft mail 1.36. many users. $5 includes shipping

Rental Center helper software and disks and big manual $5 includes shipping

Solitaire Royale disks, box, manual $5 includes shipping

ATARI hardware/software for sale:
Atari TT030 in a steel tower case... 4 internal 5.25 inch drive bays
500+ meg hard drive installed
TEN megs ST ram,
SIXTEEN megs TT ram... (26total)
TTM194 19inch monochrome
PTC1426 TT color monitor
8 bit color video card (coco)
IMAGE SPEEDER interface to an image setter... VERY FAST lino output!
Keyboard, mouse, docs, box, disks, misc. included.
This is designed as a professional publishing and image retouching
system... the system was designed for the DIDOT/RETOUCHE suite of
programs which are not included, but easily acquired from various sources.
Offers?

Codehead Utilities, release 3.....$10.
G+PLUS 1.3.....$15.
MultiDESK 2.1.....$15.
Image CAT .....$20.
Mini Office (Nicely done graphs and stuff, from UK) .....$25.

OIDS and PINBALL MAGIC (games).....both for.....$15.
All six for.....$60

Car Stereo items for sale:
All items are used but in working condition. No, They are not stolen, I just went through a phase where I liked installing and swapping around the stuff. Life's too busy to mess with it now. My lack of free time is your Big Audio Bonanza. And no, I'm not a dealer.
Some items have boxes and/or instruction books.

Car Stereo:
Mitsubishi RX791EM AM/FM High Power auto reverse cassette deck I don't know the power output other than it says "high power" on the front and it was always plenty loud for my rock and roll. There is a color code table for all the wires and connectors so you'll know what goes where. All parts are there, faceplate, knobs, etc. and it is the two-knob kind (not DIN) with an analog tuner, pushbutton presets, auto reverse, Dolby, and "NK" noise killer. All in all a pretty good deck. $make offer

Car Stereo AMPS:
Craig PowerPlay 48 watt amp $make offer
Concord HPA51 100 watt amp $make offer

Car Stereo extra special stuff:
Yamaha YEC-400 Electronic Crossover $make offer

Car Stereo Speakers:
Sony ES-S52 40 watt Coaxial 5.25 inch round speakers with grilles $make offer
Kenwood KFC-162 25 watt Coaxial 5.25 inch round speakers with grilles $make offer
Craig V203 10 watt Coaxial 5.25 inch round speakers with grilles $make offer

Car ALARMS:
Cliffalarm IMS (interior monitoring system) made by Clifford. Remote operation from fairly far away. Siren chirps when alarm is set or unset. Visible flashing LED in the car warns theives that the car is alarm protected. LED on the remote tells you remote is working fine. Panic alarm feature sounds the alarm if you hold down the remote button for 2 or 3 seconds. Shock and motion sensor is sensitive to breaking glass, but not to leaves dropping or cars passing by. Door triggers. Automatic reset after predetermined time to protection mode.
$make offer

Audiovox car alarm *BRAND NEW IN BOX* $50

Home stereo stuff:
DBX NX-40 Tape noise eliminator and disc decoder. Much better than Dolby.
$make offer

CAMERA stuff:
Hasselblad view screen for 500CM:
Plain screen #42200- $20

Zeiss Ikon/ Contaflex 35mm camera marked "(lightning flash symbol) matic" on the top, and Contaflex on the 50mm 2.8 Zeiss lens, Compur-x leaf shutter. Lens is "convertable" variety, switchable from 50mm to 35mm by changing the front elements, although I only have the 50mm lens element. Built in meter, and even a rudimentary "auto" mode. With case. I'd call it very good condition... no dings or dents, the textured black covering is perfect, the chrome is perfect, and the black finish is perfect. Optically, perfect. The only rough areas are the battery compartment has a little corrosion on the inside and a little brassing on the outside. A "ready-case" is included but the leather is torn where the front connects to the back of the case. Surely a collectors item- $150

Metz SCA-351 adapter for Leica $25

> I'll buy some if they are in JPEG. GIF is shit for data compression and wastes
> a lot of space.

GIF is very good for data compression. JPEG is "tighter" as it uses
Lossy compression. You could say "gee, this water seems lighter if I
carry it in a bucket with holes in the bottom", but you are still losing
some of your water. The GIF standard, while a bit old, uses
noiseless/lossless techniques similar to ZIP, gz, or ARC programs. JPEG,
on the other hand, uses sort of an "approximation" method. It works
pretty well, but you are still left with less picture.

BTW, what are these jerks doing cross-posting their porno ads here anyway?
I should post a bunch of ads for pictures of naked disk drives in their
newsgroups and see how they like it...

: left to try ... or is there? anyone?

Okay.
* You must have the OVL in the same folder as CAB.
* You must have the IP address and name of the DNS server. That goes in
the HOSTA file.
* DO NOT MESS WITH THE TCP PARAMETERS!
* Exception: Your MTU has to match the MTU of the host.
* Try logging on with a terminal program, and then closing it, leaving
the modem online. Then select ENABLE in the STIK dialog.
* You must have a SLIP account. Not PPP. Not CSLIP. Not TIA. Not TERM.
Real, plain simple SLIP. Any IP compression will stuff it up.
* Some sites will usually (or always) give you a read error. Probably a
bug. Try a different URL.
* Put your own address and IP in the HOSTA file, if you have a static
address.
* Make sure the baud rate is set right. Same goes for parity and
data/stop bits.
* Make sure that you are NOT using XON/XOFF flow control (software flow
control). Either use 'none' or get a patch program and use RTS/CTS
(hardware) flow control. Same goes for the modem settings.

||| they WILL need to upgrade very soon. This is a fact and will
||| probably never change though. An example of this is a friend of mine
||| who 18 months ago bought, on credit, a 386 PC with a 50 Meg HDD and
||| 2 Meg RAM for very nearly £1000 from a well known High St store.
||
||Your friend is a sucker who got ripped off.
||
||He can upgrade the RAM to 16 Meg. He can upgrade the Hard Disk to 1Gb
||and I'm sure he can upgrade almost every other component on the system
||including graphics sound and processor.
||
||Fortunately this is very easy to do on a PC. This is VERY difficult
||with an Atari.
||
|
|
|
|Let's see now. To upgrade an ST's hard disk you either:
| 1) Unplug the old one and plug in a new one at the back of the computer.
| -or-
| 2) Remove the old hard disk from its case and install a new one.
| -or-
| 3) Keep the original hard disk and plug a new one into its SCSI bus.
|
|Yup... that's tough.
|
|
||and I'm sure he can upgrade almost every other component on the system
||including graphics sound and processor.
||
|
|Show me a man who's has upgraded a 386 to a Pentium and I'll show you one
|slow Pentium computer -- if it were even possible. You can't upgrade a 386
|to Pentium because the pins of the two processors differ so radically that the
|386 motherboard could not be modified to accomodate it. Therefore, your only
|solution is a complete motherboard upgrade which is the same thing as buying
|a new computer.
|

|Let's face it, people who bought a 486 last year are STILL going to have to
|by a Pentium next year (or at least a motherboard). The PC is not this
Depends on how fast the bloat expands...

DX4/100's and above deliver low end Pentium performance even
on cheaply built 486 systems (like mine).

Intel just doesnt want anyone to know that...

2405. file lock program?

Newsgroup: comp.sys.atari.st
Date: 1995-11-22 00:00:00 UTC
From: control@u.washington.edu
Message-ID: <48udbo$caf@nntp5.u.washington.edu>
Source record: 155893

i'm looking for a program that can lock a folder. actually, i'd like the folder to be there, but just not visible unless i want it to be. if not, then something that won't allow access unless a key is pressed or somesuch. i'm using a falcon with nvdi and ease, if that matters.

thanks,
M.C.

2406. What's all this FIST FTN/Demon Gateway garbage?

Newsgroup: comp.sys.atari.st
Date: 1995-11-22 00:00:00 UTC
From: Stephen Mulrine <robotron@moroder.demon.co.uk>
Message-ID: <199511222313.AA01023@moroder.demon.co.uk>
Source record: 155894

I keep seeing articles in comp.sys.atari.st with the same subject, posted by different individuals about different topics, but always with some reference to a Fidonet gateway in the subject line. There was a spate of messages entitled "Test de la gateway fidonet-internet" not so long ago, but the current favourite is "FIST FTN/Demon Gateway Message".

Clearly, somebody's software is doing this automatically, and it's pretty stupid. The subject line should give the reader some idea of what the message topic is, and not provide a cheap advertisement for some gateway service. Does the person responsible for the software feel like providing an explanation?

Astute observers will recall that this isn't the first time a Fidonet gateway has left its mark on comp.sys.atari.st - there was all that "Re^2" rubbish about a year ago. I have my suspicions that the two outbreaks aren't entirely unconnected, but I'm not going to jump to any conclusions.

> (About $20 per meg difference from 90ns to 60ns SIMMs)

Apparently the ST/E's will read SIMMs at an Atari standard rate (150 ish), which spans to 150 ns (from around 70 ns). I have had an STE running with 4 meg of 55 ns SIMMs (gold tipped) and it worked fine but the screen would corrupt now and again. There was no speed gain over say 120 ns SIMMs but I had to put slower ones in to stop the odd lockup ...

>Zip drives cannot become boot drives for exactly the reason you just
>stated, ID can only be 5 or 6 and the ST needs ID=0

Sorry Phil but this is completely wrong! I belive that Ahdi and the like need the ID to be 0 but The ICD software & HD Driver don't care, I have used both to boot from my HD on ID 4 for years. Unfortunately I can't help with the Write Protect prob, it never happened to me! The thing is thjough that the disks may be PC formatted, this often allows you to write to the disk but virtually all data dissapears!

>Thanks for any help.

The text file formats are compatible, as long as you use ASCII text.
There is a minor incompatibility of the disk format if the TOS of the ST is old. But you can work around that problem easily with one of these two methods:

1. Format your disks on the PC (as Double Density!!!). Your Atari will have no problems reading and writing these disks.

2. There are PD utilities which can produce PC-compatible disk formats on the Atari. I have written one by myself which can make an Atari-formatted diskette PC-compatible *without destroying any data*. If you want it then E-mail me so we can find a way of transferring it to you.

Hope that helps.

On 21 Nov 1995 11:56:23 GMT Moez BENSAIED babbled on about:
: Does anybody know how i could copy a whole floppy disk in to one big file
: containing the bootsector etc.......

Magic Shadow Archiver 2.3+ will do just that. Check atari.archive or Hensa.

2416. STonX 0.5 Prerelease

Newsgroup: comp.sys.atari.st
Date: 1995-11-23 00:00:00 UTC
From: nino@complang.tuwien.ac.at
Message-ID: <491t6s$ed1@news.tuwien.ac.at>
Source record: 155721
Cross-posted to: comp.sys.atari.st,comp.emulators.misc

I have put up a prerelease version of STonX 0.5 up for ftp/http at
ftp://ftp.complang.tuwien.ac.at/pub/nino/stonx/Prerelease-0.5/
http://www.complang.tuwien.ac.at/nino/stonx/Prerelease-0.5/

Note that this is not meant to be a stable, usable version, but since I can
only test STonX on 2 different platforms, this is the only way I can find
out about configuration/compilation problems on other systems. So if you have
some time to spare, please download this version and test it! The "official"
0.5 release should be as portable and stable as possible, since it'll probably
be the last one before some major changes in the STonX sources.

Thanks,
-nino

: > In a previous article I wrote, it is said that Japanese business practice
: > is stiffling U.S. penetration of the Japanese Video Game industry.
: > Is this, true ?

Yes. Now I don't usually believe in conspiracy theories, but the
fact that the magazines have been spreading so much misinformation about
the Jaguar is pretty suspicious. Japanese companies also make it their
general practice to do things by which American standards would be called
unethical (flooding the market, blocking American companies in Japan, etc.)

: > If this is true, why haven't magazines done a full spread on this topic ?

Because every other system (besides the Jaguar) is made by a Japanese
company. That's a LOT of advertising dollars.

> Are U.S. Video Gaming Magazines anti-Atari

See above :)
?
: > If so name specifics ... (my personal of course is EGM).

Yeah, probably the worse offender.

: > In general MOST AMERICAN magazines suffer from this. I believe it is due
: > to the kind of people these magazines employ (some articles make me
: > question the level of qualification/education of these
: > "reporters/writers"). These people are thus allowed to hold onto hier bias

Most video game magazine "writers" (and I use the term loosely) don't
seem to have any qualifications whatsoever. There are exceptions, of course,
but I buy magazines mainly for the advertisements.

: > I personally prefer reading British gaming mags, as they are more in depth
: > of reporting, and provide more factual content, rather than a pile of
: > hype, and trash reporting.
: > U.S. magazines I read ? Definately NextGen, and sometimes GamePro.
: > NOTE: I think this is genuine discussion topic, do not regard it as
: flame bait.

Well, you're probably going to get flamed anyway (so will I, probably:P).
The only system I own (the only system still being manufactured, that is) is
the Jaguar. However, I feel no need to flame the other systems (or their
owners). Honestly, hardware-wise there are no bad systems (not something
that's been true in console history) out, and the fact that most of these
magazines for some mind-boggling reason take sides is ridiculous. Where
do they recruit the writers? Junior high schools across the country?

Actually, I think I got this mixed up with FTPOV (faster than pov).
I havn't looked at the source code for pov - maybe it wouldn't be that hard
just to put a few simple things into the dsp, matrix multiplications for
example, or simple but very iterative functions.

Hi Robin,

the solution is quite simple (I also had to transfer files from my
old ATARI ST to PC and back):

1. Make sure that you only use DD (double density) floppy disks. The old
ATARIs gan only deal with them, and every PC floppy drive should be
able to read and write DD disks.

2. Format these disks with the PC (not with the ATARI, since the ST would
not produce a really PC compatible format) with 80 Tracks and 9
Sectors:

DOS-PROMPT> FORMAT A: /N:9 /T:80

3. You will get disks with about 720 kByte capacity, and they can be read
and written by both PC and ATARI systems.

Of course, this is only valid for text (ASCII-) files, since binaries use
different machine code (M68000 forever! :)). But most of ATARI and PC
word processing systems are able to read and to write also ASCII-style
files. There is only one incompatibily between PCs and STs: the letter
"German eszet" (a letter resembling the greek "Beta") is eqivalent to a
PCs "Pt" (Paragraph) sign. But since you're not from Germany...

WARNING: Sometimes when using formatted disks like described above, it
happened to me that suddenly I could not read them anymore with the PC.
(Don't ask me why. Sometimes TOS would write over some Bytes of Track 00
on the disk, which are used by DOS to recognize DOS disks, during some R/W
operations).
If the same should happen to you, just format another disk as described,
and copy the "lost" files with GEM on the ATARI from the old disk (which
ATARI should still be able to read) to the new disk. After this, you can
re-format the spoilt disk within DOS, and it will do well again.

I didn't engage more into this whole subject since the procedure I
described here is efficient and simple enough for me. More sophisticated
solutions from other NEWS readers?

Bye,
Harry

2422. Wanted: MIDI Sequencer and Samples for YAMAHA DX27

Newsgroup: comp.sys.atari.st
Date: 1995-11-23 00:00:00 UTC
From: wer@iis.fhg.de
Message-ID: <491jb3$sia@iis.iis.fhg.de>
Source record: 155727

Hello,

I recently got an old YAMAHA DX27 keyboard for free, and I'd like to program it via my good old ATARI ST1040F (yeah! They still exist and they run and run and run...-> slogan of an ancient Volkswagen ad).

Since I'm not a keyboard player an have only basic music theory knowledge, I hope that I can exploit this YAMAHA tool better (many ideas, you see, but lack of skill) by sequencing it via MIDI. By the way, DX27 isn't that bad at all though it's a primitive technology. One even can program a kind of velocity sensitivity by MIDI which it normally would not have...

Please mail, e-mail fax or post me hints or binaries of public-domain software for suitable sequencers, composing or note-editing programs, or let me know about web or ftp sites containing such stuff. I already looked them through many times, but I could only find something for newer (and more powerful) synthies like PSxxx and better. Some MIDI files for DX27 would also be nice.

Oh, yes: I think I could also use software written for DX100, DX7, DX21 and similar, since these old YAMAHAS are quite alike, I guess. B.t.w., I _know_ that there are normally no _sequencers_ especially for one type of keyboard.

Thanks in advance,
Harry

I have 1040 st for sale..I tried posting a while back, and the deals fell through...I lost all the other interested parties info...so here goes again...sorry for wasting your time....

1040 ST 1meg
1224 color monitor
lotsa software
lots mags(STart etc.)
star micronics 9 pin color printer(Rainbow 1000??)
1200b modem(paper weight)

200 obo, and buyers pay shiping....there is lots stuff..more than I can name...some highlights..

email me, or call me at 714.362.8454 in southern california for info on titles....thanks....

2425. MGIFv5, request for comments

Newsgroup: comp.sys.atari.st
Date: 1995-11-23 00:00:00 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <492u8e$3bb@nyheter.chalmers.se>
Source record: 155730

Now, almost two and a half years after the release of v4.2, I really
think it's time for a general release of MGIFv5.
As always I have a lot of ideas about improvements and such, but I
guess they _can_ be put on hold for v5.01 or so... ;-)

In case you wonder, MGIF is a FreeWare colour(mapped and 24 bit) and
greyscale image viewing/manipulation program capable of a lot of things.
It runs nicely in any native graphics mode (including improvements such
as hardware and software resolution enhancers) on an ST, TT or Falcon,
as well as on any 8 bit graphics card using the VDI (MagicMac included).
Four greyscales are displayed using flicker on monochrome displays, but
no other tricks are used for getting more colours.
For details, take a look at my WWW page (see .sig).

Before releasing the current version to the general public, I'd
really want to hear what people think about the program.
There have been well over a hundred fetches of various versions of the
beta archive from my WWW page, so if everyone wrote me a couple of lines
I'd be very happy. ;-)

The manual mentions some things I'd be interested in knowing, but
anything you have to say would be much appreciated.

If I get some response to this article, I'm now aiming for a release
next weekend.

FZD is no longer supported, it cannot be registered, and the author ripped off a bunch of people by not sending them keys. I'm not supporting the distribution of a cracked key, but it's *not* going to do Aaron Hopkins any harm.

2441. Re: POSTING WITH OASIS FROM US

Newsgroup: comp.sys.atari.st
Date: 1995-11-23 00:00:00 UTC
From: info@ancient-future.com
Message-ID: <817095954_OASIS_@ancient-future.com>
Source record: 155746

```
OASIS FROM NON-DEMON ISP'S

It isn't easy to set up OASIS/NOS for ISP's that don't support local names, but
can be done. You need to get the latest NOS version NOS_POP3.ZIP from August of
1995 and copy it to your OASIS folder over the old version of NOS. Then use the
SET UP menu set things up. DON'T specify a hostname, leave that field blank
(once you get set up, don't ever select INTERNET from the SET UP menu again,
because it messes with your STARTUP.NOS and DIAL.TXT files in a way that will
make them incompatable with non-demon ISP's).

Then edit the STARTUP.NOS file as follows:

<cut here>

# startup file for KA9Q-NOS ST (DIS Version)

# you are using the domain name instead of the hostname. Most ISP's do not
# support local names, i.e. <yourname.yourisp.com> OASIS makes an assumption
# that your ISP supports local names. You have to trick it to make it work.
hostname <yourisp.com>

#dynamic IP address configuration (leave blank)

ip addr []

#The PPP commands in the sample should be OK, don't specify an ip address.
#You should be able to see the result of the negotiation by typing 'ppp sl0'
#You may need to set things going by typing 'ifconfig sl0 up' after you have
#established the dial connection. You can also do this by putting 'status up'
#at the end of your dialer file.

# Attach the SLIP driver to the serial port
# if port 0 slip dev buff mru baud
# --- ---- - ---- --- ---- --- ----

You should ask Sam Tramiel, he should know...
But it is true , that Atari has fired 15-20 people 2 weeks ago (including
Norman Kowalewski and Bill Rehbock).
It seems that they have kicked out almost all in-house Jag-software devs.

And I have heard, that Ataris R&D-chief (Mathieson (?)) and Gary Tramiel left
Atari too.

> How Odd. Are you sure the leads are all working fine ???

Hi Phil,

Still headbanging on getting a HD on the ST :-). Called ICD 4 times over the period of a week and still no response. I finally called Toad back and asked them about the problem and was told I needed to get new drivers (or accessories) from ICD and gave me another person to try there, also with no luck. I tried the BBS number and "that number has been disconnected" :-(.

In the process I got ahold of a Quantum SCSI drive (105SS) and tried that, but apparently the ICD software can not determine the number of heads and I get one partition about the size of a floppy :-). I looked through the ICDFORMAT.DAT file and neither quantum or Zip is covered, I tried faking an entry for the quantum, but it seemed to make no difference at all (if that file is more than just info, I don't know).

So far I am relativly unimpressed with ICD, nice voice mail system with recordings of promises to get back with you, but so far no luck.

Toad has been most helpful and I may call them and see if they can get in touch with a live human at ICD. I did ask if there was some other alternative to a SCSI controller for my ST and if there is, they are unaware of it :-(:-(:-(.

Dunno if I got a lemon here or not ??? I'll keep trying to scrounge SCSI drives until I find on that it will work with...

The saga continues :-).

Thanks for the response !

Take care, Vikki.

>I have heard rumours that Atari are to cease production and development
>of the Jaguar, and instead move in to PC games. Is this true?

Atari have opened a new PC software division called Atari Interactive.
The Jaguar division remains unchanged and Jagura hardware and software
development continues unabated. the rumours have taken the first part and
incorrectly assumed the second.

Wouldn't surprise me. Another sure-winner down the drain. If it's not
out within the next couple of weeks, for christmas, then they're taking
too long again. C'mon, they've got the units, they've got the software,
how long can it take to adapt one to the other!? They've had over a year
so far, their development team makes road-repair crews seem quick....

If it is true then they're as stupid as people like sinclair have been
claiming. They'll have to operate alone, as no other company will want
to know about them after being abandoned like that.... What can they do
for PC gaming that ID, Apogee, Epic, Microprose etc. haven't already
given them? Not a lot...

There is *no way* you can run most PC stuff on anything less than a
486DX2/66 with 8MB RAM and about a 300MB disc - anything less is suicide.
And this system is pretty slow - you certainly can't play many of the
modern CPU intensive games on one of them at any decent rate (they would
probably require a quad speed CD-ROM anyway. Anyway this is an Atari
newsgroup - why are we discussing this - there are better topics!

news?

It was *gossip* remember. Atari have gotten rid of almost all of their
software and hardware development staff - and they _are_ steaming ahead
with developing PC games, mostly Jaguar conversions (the first one will be
Tempest2k).

As for the dumping of the Jaguar, that _is_ gossip...

Hmm.. :) Not quite right, Phil. The ST will boot from the device with the
lowest ID. Not very helpful with the ZIP as you only have 2 IDs (or only
one if you'e got AdSCSI+) left for "other"
devices.

Yes, you will be OK. Make sure the drive is NOT differential and is either SCSI-1 or SCSI-2. Why not get a second-hand drive? There are plenty of these which meet the specs.

To connect you will need a branch in the power supply and an extension to the SCSI bus cable (or a completely new cable with the right number of connectors). Set the ID of the new drive to something different from that of the drive you already have (but NOT 6 as this is used by the AdSCSI+ clock). Remove termination from the drive closest to the host adaptor but make sure termination is ON for the last device in the chain.

Yes, yes.... the ICD s/w will cope perfectly. You will just need to format and partition the new
drive.

This is not a new situation, the h/w and s/w are designed to cope with long SCSI chains and many people have attached more HD, streamers, CD-ROM etc.

I downloaded the entire listing of the Atari Archive (0index) and printed
it out (a lot of pages, but worth it) and no where did it state one that
would play .AMS files. One said it would play 8 bit sounds, but it
would not work on my STe, I think it was called PLAYER.LZH. I do
appreciate the help though.

Anyone else have any ideas? (this is also sent to the person as a

: Hensa. You have to register to get the defrag options (v1.96 DOESN'T
: REQUIRE REGISTERING TO USE DEFRAG).

Hmm, well I have to insert something into this description about Zorg 1.96.
Yes, Zorg 1.96 will _attempt_ to defrag a hard-drive, but it seems to fall
over when you attempt to defrag a large partition. On my setup I tried to
defrag a 200meg partition, and it *ran out of memory*....surely defragging a
large hard drive shouldn't use up 2megs of memory!

: Or Try Diamond Edge (V3 ???) for a commercial defragger.

Hmm, if only I had the money for such frivolity... :)

WANTED!: FALCON SOFTWARE DEVELOPMENT & MARKETING COMPANY

Nov 23, 1995 - 1.3

---

1. INTRODUCTION

TECNATION DIGITAL WORLD, the creators of the BiT BOPPER Dynamic Graphics from Audio software for the Atari / C-Lab Falcon are seeking a 3rd party company to take over the development and marketing of this innovative product.

The software is at release 1.51, which is stable and had been well received by our initial customers.

If you're on the web, surf to:
http://www.tecnation.com
and choose CHANNEL 14

---

2. YOU

If you think you can take on BiT BOPPER and continue to DEVELOP it, and MARKET it world-wide on the Atari / C-Lab Falcon, we would like to hear from you.

Requirements:

- You must be competent
- Previous experience with the Falcon
- Previous experience with the markets BiT BOPPER is targeted towards
- You must have the financial resources to further develop and promote BiT BOPPER world-wide
- You must have the ability to create high quality marketing material to backup the innovative and eye-catching nature of BiT BOPPER
- You must have a world-wide web site, or you may use our site to promote BiT BOPPER until you get your own. (The URL for ours is shown later in this document.)

---

3. QUESTIONS AND ANSWERS

- Why is Tecnation looking to pass on BiT BOPPER?
We are now too busy with other ventures, but firmly believe the market for

BiT BOPPER is ready for exploitation - which is why we are keen to keep
the product alive!

- What are the financial details?
We will require an advance payment, followed by royalties. All negotiable.

- What will you receive as part of the deal?
We will provide our development system, and all source code, documentation
and user documentation.

- What technical support will Tecnation provide?
We will provide some up front technical support to help with any transition.

- What about Mac and PC versions of BiT BOPPER?
This is negotiable.

- What specification Falcon does BiT BOPPER require?
4Meg of RAM and at least 10Meg of hard disk space. Audio input. MIDI IN.

- How many Falcons are their in the world?
Unsure. However, now C-Lab are building them, the installed base will grow.

- Does it matter where you are based?
No! Although we would prefer a German company due to the popularity of the
Falcon in Germany, we welcome anyone from anywhere.

- Was BiT BOPPER sold under a different name before?
Yes. Falcon BiT BOPPER was previously sold as SONOVISTA, but not any more.
It is known as VIBRAVISION in Germany, however, we ask the name BiT BOPPER
is used globally to simplify matters.

---
4. FOR MORE INFORMATION ON FALCON BiT BOPPER

Use your web browser and surf to:

http://www.tecnation.com/14/

I assume theres nothing below that. Its a tad anoying because if you get a
mangled binary of the binaries groups its a pain. There are also some C .sig
files I'd like to try out ;)

I haven't had any real problems with outside on a Falcon. My setup is
basically the same (4MB Internal HD and external SCSI HD).

Outside _is_ Multitos compatible but you _MUST_ turn off the memory
protection of the 68030. To do this, copy PROTOFF.PRG to the AUTO
folder to run _before_ outside.

One thing I find in general when using outside is that best results
are achieved if you configure outside to emulate TT ram. The program
header should then be set so that the program runs in ST ram but
Mallocs are performed in TT ram. (This is simple to do if you use
Neodesk 4 or outconf.prg if you dont).

Hope this helps....

Steve Found.

You will need a fairly recent version of HuSHI to do that (6.06).
If you have that and it doesn't work, please send a detailed bug
report with "geraeteinfodatei" (^Y) and report file.

Hello All,
I was wondering if there is an e-mail Pagestream interest group,
either as a mailing list or otherwise? If not, this would be a great
thing to start.
I already run a mailing list and can't run another one. Is there
anyone who might do this? Does it already exist?

: Thanks in advance!
:

No problems. The ADSCSI+ will recognise any SCSI 2 drive you daisy chain
up to it. Just set a higher SCSI ID number for the second drive and it
will still boot from your original one. Format the new drive and off you go.

Good luck

To quote Yakko....

UhhhhhhhhhhhI don't think so...

Why would any company make _another_ machine, that costs _that_ much,
when a souped-up-TT, or C-Lab falcon could be made better, for less!?

Who's making it? What are the spec's? Will it stand up to a PPC-5200 or
such, which is what it'll be competing against as far as functionality
goes...

Just chuck an accelerator into a C-Lab Falcon. More for less...

2481. Outside on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-11-24 00:00:00 UTC
From: davidw@rd.bbc.co.uk
Message-ID: <49425p$t78@bbcnews.rd.bbc.co.uk>
Source record: 155826

I have recently managed to get hold of outside and spent yesterday
evenning trying to install it on my Falcon 030 (4Meg of memory ad
an internal hard disk). However, the entire system turned very unstable
despite its claims to be MultiTOS compatible and refused to run any
sizeable programs. Has any one out there had expereience of getting
Outside running? None of the options in the configure program seemed
to do anything more than prolong the time till the inevitable crash.

-David White

Hi

Last-time explanation why demos don't run on VGA!

When working with a VGA-Screen the Vsync frequency is
60 Hz compared to 50 Hz on a rgb-Screen. It is possible
to turn down most(!) VGA-screens to 50 Hz but even then
the bus-usage is higher(=less CPU time). Now in
most new demos it is important that the demo is
exactly timed for the best effectivity along with the music.
Having a demo running on VGA and RGB would mean to time
the whole thing twice, wich is a lot of work. And even if we
did it, it would not be as nice (See already mentioned
restrictions in the video modes; Less CPu-time=flickering effects).
I understand that most people like the VGA better, I do too
All effects are originally programmed on VGA, but when
the timing and putting together starts, we change to RGB.
And if the only reason why somebody doesn't watch demos
is because connecting the TV is a pain in the ass, then it
is not worth doing it anyway.

Last but not least I'd like to say that if there were an easy way
to do it, we would do it (And everybody else too!). But
as this is not the fact, please take yourself the time and
connect your TV, it is definitely worth the "work"!

I hope this helps.

It should work if you put in MiNT
setenv HOME=your home path

I have it like this set and it works fine.

> 1- creating a \etc\login.csh with the setenv commands

I don't know if tcsh reads login.csh when you start it normally.
try creating \etc\cshrc.csh which is always read in startup.
The name of this file may vary on different implementations
of tcsh, so read the docs.

>Can somebody tell me what I did wrong (or didn't do at all) ? By the way, I didn't install minixfs, I don't know if is of any importance...

It shouldn't make a difference.

I you mean a package that fixes the problems TOS has handling the serial
interface : Go for HSMODA??.ZIP from Harun Scheutzow, it's probably the
best, and, as far as I know it runs on all machines.

<<Hardware novice alert!!>> My hardware background is not that great,
but if a person wanted to use the drive for a boot drive, and assuming
that it is only because of the scsi address that they aren't able to,
then why not just wire the cable up so it only takes the lower address
bit and applies it to all three pins? Your scsi addresses would then
be 000 or 111. That wouldn't even require a few quid - just a splash or
two of solder. Wayne

> Thanks for any help.

The easiest thing to do would be for you to format some disk on
your PC and have him save his text files to those disks. The ST can read
and write to IBM formatted disks. The IBM, however, cannot read and
write
to ST formatted disks (unless they are formatted on the ST with one of
the
many special formatting programs that will put the IBM id at the
beginning
of the disk. Look for one of those programs and he can format the disks
himself.)

2501. Graphic web browsing for the rest of us??

Newsgroup: comp.sys.atari.st
Date: 1995-11-24 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <30b604c621fba4d1@sn.no>
Source record: 155846

I was just wondering if graphic web browsing would be available for
the rest of us Atari users who don't have SLIP accounts?

I've never had a chance to try out STiK myself, and I'm seriously
considering getting hold of a cheap 2nd hand Mac for Internet purposes
(also because of the hires colour), but it would sure be nice if I
could do graphic web browsing on my mono STe for starters.

With my provider I have access to a terminal emulation type connection
and PPP. I can get SLIP, but have to pay more- and it's not worth it
just to get graphical web access.

I use my STe as a terminal together with "Connect".
Connect is a great program, and I'd love to see some sort of "bridge"
between this program and STiK- much like I've seen for PCs and Mac
machines.

My Internet provider supplies everybody with a simple "easy to use/get
started" package which incorporates a simple VT-100 terminal emulator,
and in one of the menues you get to start up "Netscape". There's also
"Winsock" in the package, which I believe makes some sort of
"pseudo-SLIP" connection using the usual VT-xx connection to the Unix
machine (don't ask me how it works).

In other words- the system lets you in general do two things- access
all the online Unix programs (at the remote machine) like "Tin",
"Emacs", "Trn", "Mm", "Emacs", "Gopher", "Telnet", "talk", "lynx" etc.
working in the Unix environment,
or.... WWW by using "Netscape" or "Mosaic" at your own machine.

As always, the software is only available for PC and Mac... :-(
but wouldn't it be possible to make a similar system for the ST?

This discussion have already been up and discussed in the videogame group,
and it ended by the fact thoose rumours about cutting the Jaguar is
completeley false.

Atari still supports the Jaguar by 100% and will continue to do so.

I'd like to find a 30 pin, 1Meg, 120NSec SIMM for use with an old 8Bit. Did
anyone ever make any?
I'm using 80NSec, 1Meg SIMMs in my 1040 STe with no problems I
wouldn't recommend using any faster ones but these give me no problems. If anyone
actually has a set of 4 - 30pin, 1 Meg, 120NSec SIMMs, I'd be willing to trade them
a set of 100NSec ones I have not being used. I know they are good as I tested and
used them in my STe for several months without any problems.

Rich Mier

I think Atari gets more and more stupid. I think us who uses their computers (ie. Falcon etc.) should consider ourselves lucky that third parties have taken over development. At least it couldn't get worse with Atari.

A company is supposed to learn from it failors, but Atari seems like they never ever learn anything.

Typical Atari situation : 1. Has just made a new kick-*ss machine, that virtually kicks every other machine at the present time, up where the sun don't shine.

2. They totally blow it with lack of marketing and by pissing off developers.

Don't get me wrong, I like my machine. It's just Atari that pisses me off.

Keep Cool and Flying...

: and afterwards find out that the motor is not included due to the "sales
: agreement" the dealer presents you afterwards - ridiculous.

No! Well, not in UK, USA, Australia, NZ, etc etc and I think in fact
everywhere that has signed copyright conventions on intellectual property.

You have _only_ paid for the right to _use_ the software. You own the
disk and the manual but do not own the software! You just own permission
from the author to use it on one computer at a time etc etc.

You can take your car to pieces and put it back together differently...
throw a V8 in your Mini etc.
Modify a software developer's code and end up in court... especially if the
software company's name starts with "M", ends with "t" and is 9 letters
long.

Hello out there--

Has anybody used DataManager Pro? Does it use Speedo and/or something else to allow printing of labels with multiple point sizes/fonts? Or is it character based like the original DataManager?

Also, what are people's impression of Twist 2...How flexible is it when it comes to setting up and printing out labels?

TIA,
--chris

A neat little feature I found in Gemulator 95 (Gemulator 4.0) is that
you can configure your newdesk.inf so that when you click on a program
ending in .exe, .bat, or .com, it will go back to win'95 and run a
DOS/Windows program. That way you can run your favorite desktop, either
it be Neodesk 4, or whatever, and do you file manipulations with it, et, all.

Kinda cool? eh?

Eric

I believe a SCSI-II compliant drive will comply with SCSI-I as well.
You shouldn't have a problem as long as you use unique ID's and terminate
correctly.

I also have a 1040 STe, and would like information on SCSI adapters for
it. I'd like to run MiNT or Linux, and $120 for a 30 MB Megafile is a bit
steep. I already have a 100 MB SCSI drive I can use.

I am using it perfectly happily with my Sportster, so yes, it does
work. What you need to use is the Class 1 Fax driver.

You would have to run an FTP server on your TT and be online when the incoming FTP request happened. This is definitely not possible without MiNT and probably possible with MiNT although I have no idea of details.

>Alternatively, I have an FTP server script for use with Connect,

You do? I would like to get my hands on this!
>which would presumably allow file access from my local disk

Presumably only if your colleague were to dial your modem directly.

>but how would
>another internet user ftp to my demon address, and how would they get
>from there to Connect?

Not possible.

It strikes me that all you need is an intermediate FTP site with liberal policies on up/down loading so that you can upload all the files you want to get out, and your colleague can download them at will. If you want such a site, get in touch and I may be able to help.

Hmmm, out of 80 new messages today, this is the 5th such question....

Format a 720K disk on the PC. (FORMAT A: /F:720)
Copy the files on the ST onto it.
The disk is then usable equally well on either machine.

I've got a program called soft synth that allows you to create sounds
on the sound chip my manipulating the partial etc. I forget the actual
name of the synth method--Fournier Mapping?--it's a graphic display that
makes the final sound look like a mountain range...These sounds can then
be saved and loaded into a sampler and played back. It's more of a synth
than a sampler though and to the best of my knowledge (never could figure
the thing out) is not really more than a sound auditioner and doesn't
support midi. Useful to you? I could UU and ul it if you like, although
I'm not sure if its SW or not.

2530. Seagate ST1480N drive problem

Newsgroup: comp.sys.atari.st
Date: 1995-11-25 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.91.951125123615.4364B-100000@moose.erie.net>
Source record: 155785

I installed a Seagate ST1480N drive in my Mega STe a few weeks ago. I moved all the files from my previous hard drive (Quantum 240LPS) and everything seems to work fine except Zmodem file transfers. If I download files directly to the drive on any partition, I get Sense $12 or Sense $11 codes from the ICD boot software (Version 6.5.5 PRO, write verify on, read cache on, write cache off). I can transfer files all day from the desktop and never run into this problem. I never had it with the previous drive on downloads either.

I have temporarily addressed the problem by setting up a RAM disk for downloads. I then transfer the files from the RAM disk to the ST1480 with no errors. The errors ONLY occur if I'm doing Zmodem downloads. I've tried STorm and Connect and get the same results.

I'd appreciate advice from anyone who might know the cause of the errors and how to correct the problem!

Three cheers, Steve. I couldn't agree more with you. Aaron Hopkins
gets what he truly deserves. He scammed countless numbers of people
out of there FZDT keys. Come to think of it, whatever happened to
Mr. Hopkins? Did somebody give him a nice pair of cement shoes for
X-mas, or a one-way ticket to Sing-Sing Penn?

Well, anyone can telnet to your demon address, but they'd need your
password/user name to enter. :-(

Another thing you could do would be to make a web page and let people
access files from your system (be sure to make them "open" for
everybody), using the "chmod" command (if you're using Unix).
Other than that I don't know what you could do.

2535. STuff for sale, including a hard drive

Newsgroup: comp.sys.atari.st
Date: 1995-11-25 00:00:00 UTC
From: lej@prairienet.org
Message-ID: <4989si$rn2@vixen.cso.uiuc.edu>
Source record: 155790

Hey, have some STuff for sale. Email me with an offer on any of the
following items:

ST mono monitor
ST color monitor
1200 baud modem (well if you dont have a modem...)

65 Meg hard drive. its 5 1/2", in a sturdy metal case. you can even put
your monitor on top of it. has an empty bay for another drive if you like.
has all kinds of PD software on it.. its all ready to plug into your
atari. has an ICD controller inside, I believe.

1040ST.. it boots up on the floppy only, and the mouse wont work. I
haven't had a chance to run diagnostics on it yet.. may be useful for
parts, I suppose, or may be easily fixable?

lemme know!

2536. Speaker volume on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-11-25 00:00:00 UTC
From: lamarth@delphi.com
Message-ID: <hZKGjA1.lamarth@delphi.com>
Source record: 155791

Hi-

Is it just me, or has anyone out there noticed that for the CPX module FSOUND running on the Falcon that even if you crank up the volume on the speaker with FSOUND you never achieve the full volume the Falcon is capable of doing? I've tried to replay some sound files and even at '15' I can barely hear them while uninstalling FSOUND the volume's just fine (although the keyclick sounds are loud enough to make my teeth rattle :). Is this a problem with FSOUND or is there something I'm overlooking?

David (lamarth@delphi.com)

In a msg of 25 Nov 95 dhedberg@zen.kuai.se whispered to
All:

> I see, well if it's not possible to register the program anymore,
well...
> then I think it's okay to use a cracked
key.

Exactly - sure, it's not an ideal situation, but I know *I'd* rather people
were able to use the full program and the key facilitates it. Without it,
they'd be
stuck.

Aaron got swamped by demand for keys - it ended up with him just 'dumping'
it, not sending them out. He supposedly passed on support to a user group,
but nothing happened. For a while, it was possible to register in the UK
via Paul Van Bokkem, but he's long gone from the Atari scene.

Basically, Fizz is dead support
wise.

Message-ID: <499r3t$p5m@preeda.internex.net.au>
Source record: 155653

As I write this, I am using FZDT. I use it for EVERYTHING except of course graphical web browsing hehe... There is not one thing that it is not capable of doing on the net. One trick....if using IRC, change your emulation at your unix site to ANSI. Fzd wont read the vt100 in IRC properly.....other than that....I'd say you have a configuration problem....as far as ftp goes blah blah just check to see that you have RTS/CTS on and not XON/XOFF.

Ok, this is all quite simple if you know a bit about UNIX.

For someone to get into your account blah blah they of course have to
have your login name and your password. There is no other way!

Telnet will allow them to completely control and CONFIGURE your net account
however they want. FTP or NCFTP only allows file transfers.
In both the above they either have to hack their way in or you supply them
the details. For them to get into your home system...there is no way they
can do this via the net. They must log into your computer directly while
you have Connect (or any other term .prg) running.

Just edit your dial.scr file to logon and start the TIA program.
My script looks like this:

FIND = continue:
RESP = |
#
FIND = login:
RESP = ae
#
FIND = Password:
RESP = n/a ;)
#
FIND = ENTER...
RESP = |
#
FIND = $
RESP = tia

And that's it. Your login procedure may be shorter/longer but it's really
not harder than that.

>Here's what I have so far:

I'm not familiar with Stalker (can't afford stuff like that :)).
However if its anything like other comms programs the setup is
probably the problem. An example is when you first begin a Zmodem
download. You tell the BBS you want a file by Zmodem and then when
the otehr computers ready it sends a string (something like:
*B0000000000) which your comms program recognises, and begins
downloading. If you can try and find where you can set such a string,
and then use another (simple, eg. vanterm) comms program to see what
string is sent before the download, and make sure the two match).

I hope theis helps. Try using X-modem, I'm not sure but I don't think
that uses a string to initiate the download.

Hope this helps

> Spectre, and not only Word 0.999, Excel 0.25 Pagemaker 0.001 !!!

You are correct in as much as you could actually LOAD that software. But, heck, I upgraded my LC II (which is a 16MHz 68030) to a 25/50MHz 040 because
those programs ran so slowly on it. As we know, an Atari running Spectre GCR CERTAINLY is not as fast as an LC II.

So, knowing this, the issue now becomes do you WANT to work extremely slow running software even though you CAN run it. Just because it loads it doesn't mean you necessarily want to use it (this is true of Word 6.01 on my 25/50MHz 68040).

And do you really want to spend money NOW to run yesterday's software? I think not... but that's me.

2548. FS: 520ST system

Newsgroup: comp.sys.atari.st
Date: 1995-11-26 00:00:00 UTC
From: marks@ssdevo.enet.dec.com
Message-ID: <49aqi7$80v@nntpd2.cxo.dec.com>
Source record: 155663

I have the following ATARI ST hardware and software for sale.
The computer worked when I shipped it to my Dad last year, but it didn't
run properly when he received it. He tried troubleshooting it,
but couldn't get it to run reliably. At this point I suspect the
system board, but he lives in Wisconsin, and I'm in Colorado. So I can't
diagnose it, but it sounds like a problem on the system board, since
it displays bombs when booting.

I'll sell everything below for $200 plus shipping, or individually as shown.

520ST (old style) with additional 512K memory kit $40 + shipping
Complete with mouse and user guides.
Currently does not run reliably, but could be something
as simple as re-seating chips, or maybe the power
supply is on the fritz.

ATARI SC1224 color monitor $100 + shipping
Includes original packing

(2) DSDD floppy disk drives w/ power supplies $50 ea. + ship.

ATARI ST software $30 + shipping
- spreadsheet (includes user guide)
- database program (includes user guide)
- PASCAL programming language (includes user guide)
- a bunch of miscellaneous software on floppies

Atari Falcon030 with 4 Meg ram & 84 Meg HD.

Includes all the S/W that came with US Falcons
(Atari Works, D2D, AFM, etc.), ICD Pro hard drive
software, NeoDesk 4, Geneva, Warp 9, VGA adapter,
SC1224 adapter plug,, and various other S/W
downloaded from the net.

I'll also include a SCSI 2 cable for hook-up to
external SCSI devices.

Approx. 2.5 years old, in perfect condition.

Asking $650.00 USD plus shipping.

I live in Richardson, Texas (north of Dallas).

Also for Sale:

Calamus SL (10/31/94) - $150.00 plus font editor & vector images
VIDI ST cart and s/w - $40.00 Video image digitizer
Migraph Hand Scanner
plus Touch-Up v1.69 - $75.00 plus scan & save, merge it s/w
Diamond Back 3 - $30.00 hard drive backup
HiSoft Basic 2.02 - $20.00

All above come with original boxes and user manuals. Price includes
shipping.

Send mail to rhoekstra@why.net or rhoekstra1@aol.com

It's because they all use Unix-shells on their ST's and don't play games :)

Nah, if it's got anything to do with the Atari 68000 computers, then this
is the group, games or otherwise.

Don't bother with rec.games.video.atari - it's just Jaguar stuff, and
about 80% of it is just "my console is better than yours" postings.

>

Must be your setup. I've been using FDT for the last few years, I'm one of
the ones that got my personalised key. It NEVER crashes, Storm does, STalker
does, but not FDT. It automatically starts file-transfers via either
XYZ.TTP or GSZRZ, which-ever I want to use. This is on a 4meg STe with
14400 baud modem. If Teddy-Term is the one I think it is, whenever I tried
using it, every second button I pressed would be a "quit" button. I'd
use STalker if I could as FDT doesn't like IRC, but STalker doesn't seem
to like some of the particular command sequences that my service provider
sends it. Flash and uniterm don't seem to care however.... I have no
difficulty leaving FDT to download 2meg files, even running it under
Geneva, which I've _finally_ worked out the problem with
"over-optimising" program setups with... :)

FDT doesn't have a very good flow-control routine, but if you use
HSMODEM-04 with DRVIN.PRG and MFP.PRG in the AUTO folder, and lock the
MODEM.CPX to 19200baud with RTS/CTS turned on, then you have very few
worries.

>

Yep, they just need your name and password, and they can do everything
you can. And rack up the same costs for your bill! :)

> Alternatively, I have an FTP server script for use with Connect, which
> would presumably allow file access from my local disk, but how would
> another internet user ftp to my demon address, and how would they get
> from there to Connect?

They run FTP. Type "open ftp.demon.co.uk"
when asked for a name, they type "dave"
when asked for a password, they type your password.

They then type "binary" to make sure stuff is transferred in binary, they
can then GET or PUT any files from/to your directory that they want to.

I do this all the time. I often telnet to my account in Norway, and FTP
stuff from there, and then send it to myself, as the connection to sites
such as atari.archive.umich.edu is about 10 times quicker if I do it that
way, probably saves me a couple of minutes! :) As long as I use Gopher
that is - the _only_ way you can ever connect to atari-archive...

Just to clarify what I have, it's just the main unit and the power cord,
no box, mouse, manuals, monitor etc.. and it's guaranteed until Jan 10th.

Thanks,

You are mangling up legal standards.

>You have _only_ paid for the right to _use_ the software. You own the
>disk and the manual but do not own the software!

Of course you do, what else was the contract about?

>You just own permission
>from the author to use it on one computer at a time etc etc.

That's what they try to _tell_ you. Of course, running software on two
computers is not allowed, since you only bought one copy, that's special
with software, as any copy is as good as the original.

>Modify a software developer's code and end up in court... especially if the
>software company's name starts with "M", ends with "t" and is 9 letters
>long.

I am not sure if this complies to international copyright laws. It's
illegal to redistribute modified code under the name of the original
producer, but whether a modifie_r_ software is illegal...
BTW, SoftRAM contains Microsoft's code mostly.

2562. Re: Does EPSS work as an Accessory on a TT?

Newsgroup: comp.sys.atari.st
Date: 1995-11-26 00:00:00 UTC
From: magnus.kollberg@p11.straight.ct.se
Message-ID: <ftn_2.203.221.11$fidonet.org_30b8813d_Magnus.Kollberg@p11.straight.ct.se>
Source record: 155677

In a message a eriksson wrote to Magnus Kollberg:
ae> You really have to ask Conny Pettersson about that.

I have already done that some time ago, but he just said the same as you say..

ae> But I'm, pretty sure he would be positive to give out the EPSS driver
ae> info to you if you are interested to write a DSP driver for it.

I would be, the problem is that I don't know how to program the DSP. Maybe
someone else want to do it?

ae> Actually, I think EPSS is shipped along with Zero-X if you buy that one
ae> (also from Conny), and if he get alot of feedback I think he'll write
ae> that DSP driver himself. Give him a call at +46-13-164104.

I have as I already said written to him some time ago and he did say that they
might get back to EPSS if there were enough interest in it. The problem isn't
that people doesn't want it, it's that people doesn't even know that it exist.
;-(

ae> Tord Jansson is the father of the UCDM standard used in the Octalyser,
ae> Player, Obsession etc, and a while ago, I recall Conny was planning to
ae> add direct support for UCDM players in EPSS.

Sounds interesting, but there is no DSP UCDM players for the falcon or is
there? I mentioned Tords name because I know that he were working on a player
for the DSP. If he have done it and it's a UCDM player and EPSS supports it we
can start talking business. :-)))

I would also think tha C-lab would be very interested in selling this program
with the falcon. It would be a perfect "musicpack". :-)

mvh,
Magnus Kollberg

This is blooming wierd - Zmodem interfering with the
HD???

Have you tried it with the ICD driver cache ON? I guess this might cure it rather as Z-ing to a RAM disc did. But it gets no nearer to discovering the cause.

: i) Atari and Virtuality have parted company, re develpoment of the VR
: headset, which won't now be available for Jag.

Virtuality hasn't been officially killed but there are two
serious problems with it. First, the optics technology that Atari
received from Virtuality sucked and was sent back. Second, the price of
the headsets was a little too high.

: ii) Atari are soon going to stop making Jaguars and concentrate on
: making PC software.

In the last couple of weeks, Atari reps have come on the net
refuting this. While Atari is looking at entering the PC market, it
only has one game finished so far. Hardly enough product to justify
stopping development of the Jaguar. Atari is 100% behind the Jaguar this
X-Mas and through 1996 at least.

I installed a 50mhz clock on the DSP and tied my 25mhz FPU
onto the 50mhz clock also. The DSP runs very hot. I purchased
a small fan and mounted it by the DSP for cooling. I tapped
the power from the floppy cable. Now it runs cool :). It's
hard to benchmark the DSP, but the FPU runs at about 308%
by Gembench. Putting a stop watch on the DSP shows a slightly
quicker load time for JPGS.
If anyone is interested, I have my Mighty Sonic working
at 32mhz with the DSP, SCSI bus and Fast ram. I don't know
why, but after I installed the Power Up 2, I reasoned that
it might act as a buffer as well as a speeder. Leaving the

Power Up 2 installed, I reinstalled the Mighty Sonic with
NO clock Patch (rev J M/B). I did disconect the 32mhz input
from the Power Up. I am running slow-blit in the autofolder.
I have a test drive hooked up and after a week have had no
SCSI problems, although using Extendos Pro to access the CD
seems flakey for some reason. My floppy is also acting up too.
Apex Media and Rainbow, both heavy DSP users, work well.
Anyone have any ideas on the floppy problem? Also, the internal
cach keeps shutting off. Can this be locked?

Mike

Hi

I recently sold various bits of hardware and software for some
people... including full system setups. The stuff was usually sold
within 2 weeks of the seller approaching me about their stuff compared
to them trying to sell for months on end.

If you are looking for some particular harware or software, approach
me for what I have available. There is no charge to the buyer.

Due to the success of this, I am now going public, and for a small
commission will sell your stuff. Just contact me with what you have,
and I will try and find a buyer for your stuff.

I will look out in the various places I lurk for buyers and will also
put your 'advert' on my web page, under a special new section I am
creating.

I am asking for a small price only...

10% for hardware
5% for software
10% for Full setups

For more details, contact me aeither of the addresses below.

Regards
Danny

I have sometimes found that problems with articles can actually be
caused by the group before the one where the problem occurs.

2587. tos to msdos

Newsgroup: comp.sys.atari.st
Date: 1995-11-27 00:00:00 UTC
From: nicole@seas.smu.edu
Message-ID: <49d6vh$lga@giant.seas.smu.edu>
Source record: 155605

there are some progs that put stamp an ms-dos serial number onto
desktop-formatted atari tos disks without destroying their formats.
The serial number is only difference between the
ms-dos format and the normal atari st format.
assuming you didn't format your tos disks using some other method than
the formatter that comes built-in with tos, and you made double-sided,
double density disks, you should be able to
easily convert from tos to ms-dos readable. Putting the ms-dos serial
number stamp on tos disks leaves them readable on atari, too; it
doesn't interfere with "normal" tos operation.

I've never tried the operation with a single-sided tos-formatted disk.
I have had trouble with disks formatted using other utilities to
achieve higher density on what would normally be a 720k disk. But
every one of the several desktop formatted disks containing text files
has worked to transfer plain ascii text files to my wife's PC at work.

I have successfully used a utility called dc-format302 to do this.
It has a menu item called MS-DOS boot that makes the change
simply. Be sure to only select ms-dos boot if you use this utility.
Don't accidentally format your disk, erasing the info you want to transfer.
There are, of course, some other utilities that do the same thing, but
I have no experience with them. I think you'll find dcformat302 in
the atari.archive.umich.edu under the menu dedicated to dc, but I'm
not certain. It came with a package deal I got somewhere: I didn't
download it from an archive myself. I'm sure other replies will point
you to other utilities that are definitely in online archives at th e
present.

Good luck.

Aha! This sounds familiar, I have experienced this. I cured it by a
large dose of Reindexing. Well, just try reindexing the JUNK for starters.
Also don't meddle with the newsfiles. I had 'external error's ' when
I had left a .BAK file in the news folder (Oops [g])

You can't run Linux on a STE. You need at least a 68030 with a FPU.
Sorry about that.

There are several possible reasons for timeouts. First of all, if you use
X or YModem, you have to specifically tell STalker to "Download binary
file".

If you use ZModem, you need to make sure the "automatic ZModem transfers"
button is checked. Furthermore, the initialization sequence will not be
seen by STalker if your communication settings are not correct. If you
normally use 8 bits/No parity, try switching to 7 bits/0 (Space) parity,
or vice-versa.

It's very easy. Format the disk on the Mac as a PC-compatible disk. Just make sure you don't use a 1.44M floppy unless you have that type of drive on the Atari. Then just take it over to the Atari and write the files to it.

My hard disk (attached via the Link II) needs about 10 secs to get ready,
if the ST is turned on before this, it is ignored, otherswise it is
booted.

There are various programs (some of which go in the AUTO folder (of the
floppy disk), some of which write to the boot sector of a floppy disk)
which sees if you have a HDD attached, and then waits until it is ready
before allowing the ST to continue booting.

This saves me loads of hassle and a fair bit of time too!

2607. Problems with GEMview!

Newsgroup: comp.sys.atari.st
Date: 1995-11-27 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <30b9e088afedc52@sn.no>
Source record: 155625

I'm having a strange problem with "Gemview".
I'm not able to load/save more than a few formats, and not the usual
GIF, TARGA, JPEG etc.

I've checked the paths and the files and it's all there correctly set
up! I haven't used it for some time now, but last time I used it I got
it working fine.
Are there any other things to "set" to make it work?
I tried different path settings, but it gave me error messages in the
log window, but even when I set it up correctly it didn't work.
Any ideas?

MasterTracks works in colour. So does Cubase's ancestor, Steinberg 24.
Alchemie, Band-in-a-Box, Dr T's KCS, Edit Track, all work in colour.

I have a brand-new power mac (PPC 603, 8megs) And I would like to emulate Falcon, so I can better cooperate with my roommate (who owns a Falcon 030) in songwriting.

Does anyone know where I can obtain a good emulator(in the states) ?

Also, has anyone heared about a recent update for Clarity (a sampling/midi/sequencing application) ? It suits our needs well, but it isn't very stable... Often crashes within 45 min. of launching.

IOMEGA only gives the information to people that pay for it, it seems.
Nevertheless I got it and I intend to post it as soon as I could check that my
information is correct. (I didn't pay or sign for anything.)
They use a very ugly method as they don't use a vendor specific MODE SELECT
page for configuring write protection but the SCSI opcode $0C.

I don't know much about Giana Sisters, but there is the "legal" version of SMB for the ST called Super STarioland that was just released. I've played the demo version from ST Format, and it really stinks!!!

The control and layout of the levels really sucked. And the demo makes you play on the harder levels at first sometimes. Myomoto put alot of heart into the Mario games and this STario game is a stupid ripoff. :P

If you want a REAL good platformer, get Killing Game Show. You'll never be disappointed. :)

I was trying to write up an ST newbie FAQ, but as usually it wound up on the back burner of the many things I have/want to do. Think I'll just only tell how to transfer between PC and ST using the DOS floppy and where to get some stuff off the Atari sites. :)

> >Sell your PC...use an Atari...have more fun!
>
> I'm with you there! Or forget your plans about getting a PC!!!

The only thing really worth owning the PC is for the games. I know, I know...but the qualtiy of commercial ST has really gone down the commode and the only good stuff you can find is on the Internet. 'sides, PC games are alot better than those next generation jokes IMHO.

At least if you very little money, you can pick up a 2nd hand ST and get games for almost nothing :)

I have been dreaming of such a utility but I don't think one exists. I asked the author of ProTracker ST, Karl Anders Oygard, if it was technically feasible and he reckons so, with a lot of hacking (it's all down to the large amount of data that would need to be handled with some very precise timing) but he's not going to write it.

I also recall that Damien Jones of Soundlab was planning a version 2, which would support such a feature. That'd be cool. Currently I've used only 95Mb of my 540Mb drive and I'd love to fill it up with some huge samples. There is a STOS program kicking around that will sample to harddisk at 20kHz mono, but that's hardly using the STe features is it?

Otherwise I'm stuck with samples that fit into RAM :(

They had a thing warning about the Good Times virus. Weeks later, my
dorm hall computer lab posted signs warning people not to read mail named
"Good Times". Then in STF someone wrote in saying it was all a hoax.

Guess what, my lab still has those signs posted all over the halls! :)

BTW, the last issue of ST Format is a piece of rubbish. Nothing new and
interesting except for the review of the cool looking Awia CD-ROM and a
piece on the ST web browser. The STarioland demo was the worst coded
crap I've seen, it uses sounds like a 2600 for crying out loud! I only
got it b/c it had a MIDI player and some files I need for my project, the
player ain't so hot using just the Yammie chip :(

Well, I have been having an annoying problem with STalker for some time that I haven't been able to track down, this thread reminds me to finally try to solve the thing. And since Dan Wilga seems tuned in currently, maybe I'll finally resolve it.

I can't send files using z-modem.

I can receive them fine, but sending them reults in a torrent of failed packet ackowledgments. The thing send the same packet over and over agian. It doesn't matter who I send to, my local ISP's UNIX machine, my local Atari ST base BBS, local IBM base BBS's, etc...

The problem used to be worse. Used to be the first error result in a complete lock-up of my system. Hours of trial and error resulted in the discovery that the proble was, believe it or not, the LED corner clock utility! Now that I run without it I can actually turn my modem on and off without crashing my computer! But sending z-modem still does not work. I have had to resort to straight x-modem sends.

Oh, by the way, I found no difference between using HSMODEM or not using HSMODEM.

: > DO NOT USE HSMODEM WITH STALKER
: >
: > They are not compatible... Install the appropriate serial patches that

Any suggestions? I'm running a Falcon with TOS4.04, the latest Geneva, NeoDesk, latest STalker, etc... I'd like to keep HSMODEM in my auto-folder for the sake of STiK., What else? FPATCH2, of course. I don't know, that's all I can think of.

Just check that the 2 paths are set up correctly but the thing MIGHT be this,
Gemview is shareware and to encourage registrations it begins to load up slower
and limit itself after 30 days (or so I understand) so maybe this is true. Not
sure about it though, try re-installing it.

Are you sure that you want Floating Point?!? It'll be VERY slow... Fixed point (where you use integers that are shifted left) would be much faster (assuming no FPU). If you want, I can mail fixed point routines (using '030 code though).

Of course, you'll loose acuracy when you zoom in a long way...

> restrictions in the video modes; Less CPu-time=flickering effects).

We VGA owners who do not have (easy) access to a TV would prefer
flickering effects to no effects at all... If the code at the
beginning didn't abort te program, but gave a warning that it
would be better on RGB, and then changed to a VGA mode, we
could cope. I would then be able to at least get an idea about
what coders are doing, which is more than I can do at the moment...

> I understand that most people like the VGA better, I do too
> All effects are originally programmed on VGA, but when
> the timing and putting together starts, we change to RGB.

How about a demo that showed what could be done on VGA???

> And if the only reason why somebody doesn't watch demos
> is because connecting the TV is a pain in the ass, then it
> is not worth doing it anyway.

It certainly is a pain in the ass taking my Falcon on a 4-hour
train ride, just to see a demo... So could I not get an idea of
what it does on my sVGA first??? (Note: I dont bother...)

(the only TV in my house has no external arial socket...)

> Last but not least I'd like to say that if there were an easy way
> to do it, we would do it (And everybody else too!). But
> as this is not the fact, please take yourself the time and

: :Another Atari-clone will come out early next year. It is called Hades, and
: no, I think not, the price is WAY to high!

Considering what the compuer does in performance etc, it is at a nice
price... competing directly with the Mac and the PC. I saw it at
ProTOS and I was well impressed. :-) Maybe I will buy one when it is
available in England.

: > I use CS-TeX 4.0, and 2e runs beautifully on it.
: Where did you get TeX 4.0?
Oh, it's not _TeX_ 4.0. TeX itself will never go higher than /pi, or at least that's what Donald Knuth says. It's just the version of the TeX system (along with the extra system specific features) that's at 4.0
: I'm still using something called MultiTeX which I bought years ago,
: and I can't help suspecting that there may be something better ...
AFAIK, MultiTeX is CS-TeX 5 or higher. After 4.0, CS-TeX went commerical.

Source record: 155687
Cross-posted to: news.announce.newgroups,news.groups,comp.os.linux.development.system,comp.unix.amiga,comp.sys.amiga.applications,de.comp.sys.amiga.unix,maus.os.linux68k,comp.sys.atari.st

```
FIRST CALL FOR VOTES (of 2)
unmoderated group comp.os.linux.m68k

Newsgroups line:
comp.os.linux.m68k Linux operating system on 680x0 Amiga, Atari, VME.

Votes must be received by 23:59:59 UTC, 18 Dec 1995.

This vote is being conducted by a neutral third party. Questions
about the proposed group should be directed to the proponent.

Proponent: Chris Lawrence <lawrenc@cs.rose-hulman.edu>
Votetaker: Steve Bonine <spb@ntrs.com>

RATIONALE: comp.os.linux.m68k

Current traffic on the dedicated Linux/m68k mailing list is
approximately 25 posts/day. In addition, there are about 5 posts
relating to Linux/m68k per day in comp.unix.amiga, and at least 20
posts per day in the multilingual maus.os.linux68k newsgroup, which
does not propogate very widely. Interest in the Motorola 680x0 port
of Linux is growing substantially, and there is no Usenet-wide group
at present that fulfills this need.

CHARTER: comp.os.linux.m68k

The group comp.os.linux.m68k will not be moderated. It is intended to
further interest in, and development of, the port of the Linux
operating system to the 680x0 architecture. It is anticipated that
almost all discussion in the newsgroup will be in English.

END CHARTER.

HOW TO VOTE:

You should send E-MAIL (posts to a newsgroup are invalid) to:

voting@ntrs.com

Check the address before you mail your vote. Your mail message must contain
one and only one of the following vote statements for each group:

I vote YES on comp.os.linux.m68k
I vote NO on comp.os.linux.m68k

You can also vote ABSTAIN or CANCEL. These votes are not counted in the
results, and CANCEL removes your name from the vote listing in the result.
```

Names are required for this vote. The counting software will extract your name from the mail message if your mailer is properly configured; if your mail software does not indicate your real name, you must include the following statement and add your name (on the same line).

Voter name:

Vote counting is automated. Failure to follow these directions may mean that your vote does not get counted. If you do not receive an acknowledgment of your vote within three days contact the votetaker about the problem. IT'S YOUR RESPONSIBILITY TO MAKE SURE YOUR VOTE IS REGISTERED CORRECTLY.

If you wish to change your vote, simply vote again from the same account; duplicate votes are resolved in favor of the most recent vote.

THIS IS NOT A SECRET VOTE. Names, addresses, and votes will be published in a RESULTS article in the same newsgroups in which this CFV appears.

The purpose of a Usenet vote is to determine the genuine interest of persons with Usenet access who wish the proposed newsgroup to exist. Soliciting votes from disinterested parties defeats this purpose. Please do not distribute this CFV. If you must, direct people to the official CFV as posted to news.announce.newgroups. Distributing pre-marked or edited copies of this CFV is vote fraud. When in doubt, ask the votetaker.

Standard Guidelines for voting apply. One person, one vote. Votes must be mailed directly from the voter to the votetaker. Anonymous, forwarded or proxy votes are not valid. Votes mailed by WWW servers are considered to be anonymous votes.

DISTRIBUTION:

In addition to the groups named in the Newsgroups: header, the CFV and the eventual RESULT posts will be mailed to the mailing lists:

linux-m68k@phil.uni-sb.de
To join, send mail to majordomo@phil.uni-sb.de with a blank subject and the line "subscribe linux-m68k" in the body.

2639. Re: **FREE GIFS FREE**

Newsgroup: comp.sys.atari.st
Date: 1995-11-27 00:00:00 UTC
From: Birger Wathne <Birger.Wathne@nho.hydro.com>
Message-ID: <30B9962C.5DB7@nho.hydro.com>
Source record: 155688
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.amiga.graphics,comp.sys.amiga.hardware,comp.sys.amiga.marketplace,comp.sys.apollo,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.handhelds,control

Sorry. I just had to add some info. After this, let this thread die, ok?

GIF doesn't loose data, but is restricted to 8 bits of information.
Which means only 256 colors. But if the original picture is a 24-bit
image you loose big time, as you have to reduce it to 256 colors first.

JPEG is 'lossy', but is a 24 bit format. Which means you propably
get all the colors you want.

I would say you loose far more data with GIF if you reduce a good
picture to 8 bit of data format. With JPEG you can vary the amount
of loss to suit your needs regarding compression and picture quality.
A 24-bit picture saved as a JPEG can look better and still be
smaller than the GIF equivalent.

GIF: Use for business graphics (as JPEG is at its worst with
graphs and other pictures with solid colors and sharp edges).

JPEG: Use for all photographic material. If people only have
8 bit screens, and want to reduce the picture to GIF to get
faster loading, let them do so themselves.

The dithering algorithm used when decompressing the JPEG file
will make a big difference. Just compare Sun's 'imagetool' (quick,
but coarse) with 'xv' (run with 'xv -perfect -8 -slow24' if you have
an 8-bit screen).

2641. MiNT and accessories

Newsgroup: comp.sys.atari.st
Date: 1995-11-27 00:00:00 UTC
From: c.evans@student.canterbury.ac.nz
Message-ID: <c.evans-2711952004340001@132.181.31.106>
Source record: 155690

Can anyone explain what the problem is here?

If I boot up to the Desktop with MiNT, I can load one accessory fine. When I try to load up more than one though, the whole thing crashes. Am I doing something wrong, or is there some deeper meaning to all this?

Possibly relevant details:

My system is a 520STfm with 2.5M memory, single DS/DD floppy, ~270M SCSI HD with ICD Link 2 adaptor. Running TOS 1.2 (UK), MiNT 1.12 from binary distribution (probably from hensa).

Almost every accessory I have works by itself, but no combination of two or more I've tried does. It doesn't seem to matter whether or not I load MinixFS, or any combination of AUTO programs.

2646. Re: Zip _could_ be used as boot device

Newsgroup: comp.sys.atari.st
Date: 1995-11-27 00:00:00 UTC
From: fezzy@iinet.com.au
Message-ID: <49an0b$8sd@jazz.iinet.com.au>
Source record: 155695

buxmjp@zippy.dct.ac.uk wrote:
: It occurs to me that a ZIP drive can be used as a boot device, if you change
: the SCSI ID using a bit of hardware. The scsi addresses the device can
: occupy are 110 and 111 (bin). To boot using most host adaptors, it needs
: 000. Either the whole scsi bus can have invertors added, inverting
: every devices ID, or the zip drive on its own could have the
: invertors in the scsi device ID section.

After a lot of messing about, a few emails to ICD, (who offered LITTLE
or NO help) a call for help in this group (THANKS to all who replied with
special thanks to Julian Gifford and Richard @ Zippy innovations (both
Australians)).

We (Lance, Edwin & myself) now have ZIP drives up & running as a BOOT
drive on ST machines. Lance came up with a VERY NICE way of getting power
to the Link-II without messing about with a lead from the ST J/stick port
and without modifying the ZIP in any way..... He has made an adaptor to go
from the centronics 50pin (on the Link-II) to the ZIP D25 which takes
power from the zip drive for the Link II.....

I can advise that it WORKS well as a BOOT drive. All you do is; plug in
the zip (using the above adaptor) set the SCSI ID to 5 or 6, switch the
TERMINATION to ON, then format & partion the cartridge with the supplied
ICD (LinkII) software. Via the ICD config HD_UTIL.PRG set the drive to
auto boot and Bob's your uncle..... A 100 meg (100.66 to be exact) low
cost, QUIET drive.

There is one little PROBLEM though, the ST won't boot the drive 1st time
when the drive is switched on from 'cold' (this is a TOS problem I
believe, which is documented in the ICD book re Quantum & Seagate drives
on page 63 of the ICD manual.... Note bootfix.prg will NOT fix it) It's
not a major problem, a reset or cold boot of the ST WITHOUT switching off
the zip will then allow the zip to boot. ICD have come to the rescue
here, with COLDBOOT.PRG. just put this little prg in the auto folder of
the 'A' drive and the reset/coldboot is done for you, thanks ICD....

I will speak with Lance to see if he will release the details on how to
make the above adaptor, if so I'll post it in this group....

PLEASE NOTE
^^^^^^^^^^^
All of the above has worked for Lance, Edwin and myself. On 1040 STe TOS
1.62, 1040 STe TOS 2.06 and MSTe TOS 2.06. I cannot guarantee it will work
for all ST's and TOS versions...

>
> Paul

Actually, we not necessarily expect to see an "upgraded" driver for the
660. Now, before anyone gets upset I should point out that I recently
obtained the PCL list specifically for the 600 & 850 series printers.
While there are some differences, for text printing and graphics
printing, there are no substantial differences between the 550C and
600/660 series. In other words, the Calamus 550C driver will work
perfectly with the 660. Besides, for graphics printing the 660C still has
the same limitation as the 550C, 300dpi. The 600 dpi is only for black
(text).

However, what is better is that the 600 and 850 series printers support a
broader range of media and heavier gauge papers. The 500 series was very
limited in this respect.

If possible, I will attempt to work on an upgraded Calamus print driver
for the 660C, but I point out that this benefit will only be in regard to
the selection of paper & envelope sizes.

This is an FYI exclusive.

Try:
ftp://src.doc.ic.ac.uk/packages/Linux/tsx-11-mirror/680x0/

However, Linux (and all other Unixes AFAIK) requires a Memory Management Unit (MMU) like that provided in 68030 chips. Your STE does not have an MMU like this so you cannot run Linux even if you did get the files.

Either:
1) upgrade to a Falcon or TT; or
2) get a CPU upgrade for your STE, like the PAK/68k board.

Yes. However the printer drivers for Mac printers only work (AFAIK)
by generating page bitmaps and sending them to the real Mac drivers.

: "verify on"?

Because of that, yes. And because Kobold 2 used very small buffer (it only transferred about 1.5 megabytes in one read/write at the time). When the system may transfer continuously (e.g. in hard disk recording), then it can reach such speeds as 3.1 MB/s, if not even higher.

Try copying 100 megabytes using DOS or TOS copy (file by file)... ;-)

Have some good movies to watch, and a cup of coffee, though 8) !

phil4@phil4.demon.co.uk (Phil Hough) wrote:

> where can I get hold of this EPSS demo accessory thing, it sounds
> quite interesting !!

EPSSATOM.ZIP is available as follows:

gopher://gopher.archive.umich.edu:7055/11/atari/Demos
ftp://src.doc.ic.ac.uk/pub/computing/systems/atari/umich/Demos/

There is also the dynamite demo, though I can't remember where I found it. This has about 20 minutes of music which, for me at least, sounds even better than the EPSSATOM demo. If you type MIDI IN while it's playing the music stops and you can play the EPSS sounds from another midi source.

The following is from the EPSSATOM.ZIP demo readme file:
(N.B Apparently the full EPSS comes with a 16 channel polyphonic midi soundriver for the TT030 & another driver has 50 kHz channels)

* 8 channel polyphony (depends on loaded sounddriver)
* 25 kHz effective replay frequency (depends on loaded sounddriver)
* Independent volumes and pitch on each sound
* Independent stereo-panning of each sound
* Variable looping of each sound
* Unlimited samplelength
* Maximum 256 sounds in one patch
* Maximum 128 different sounds on every MIDI-channel
* Velocity Variant Filter Emulation, VVFE, to achive filereffects
* Subtones, make new sounds of existing samples with different parameters
* Used integrated with your favourite sequencer
* EPSS Export Driver for MROS(R) to be used with all MROS(R) based sequencers
* Uses external sound-drivers which can support different hardware
* Use the drivers in your own programs or demos for playing the songs
* MIDI-In, Out and Thru
* Replay possible from MID-files without any sequencer loaded
* Integrated sample and sound editor
* Direct loading of samples from Roland S-50-discs
* GEM Multi-Window environment compatible with MultiTOS and Falcon
* Runs both as Program or ACCessory

...and much more...

And even if you know it exists how do you pay 30 UK pounds plus
postage and packing (as of about May 1995) to a PostGirot Utland -
Postal Giro Account in Sweden... and in what currency? I've been
trying to work it out since September?

If the demos are anything to go by it's a great program, but it needs
a UK (at least) distributor. The same goes for the (demo of) Zero-X.

> Those were impressive speed figures!

I used an extended IDE cable, and yes, my Falcon is in a PC (yuck) case.. In fact, it looks just like an ancient 8088 XT, which it used to be. Now I could call it Falcon FXT ;-) (I use the FX accelerator). The driver is crucial: I use HDdriver, since it seems to create by far the fastest IDE access on Falcon. The driver has to support both IDE 0 and 1 units, and multiple read/write -feature improves performance greatly.

Though most Atari hard disk drivers are virtually similar in what comes to speed of SCSI/ACSI-drives, the differences when using IDE are huge!

Greetings,
Tommi

1st get one of those plastic canisters that 35mm film comes in, you need it put the screws in, use one with a lid, keeps the screws safe until you come to re-assembly.
Tools needed: Phillips screwdriver (crosshead I prefer No2 size) and a pair of narrow nose pliers. Good size table, to spread the bits out.
Turn the ST upside down. Remove all the screws except for the three directly under the disk drive (turn the ST over to check these, if you don't the drive will fall out, obvious, no ?)
With all the screws out, carefully turn the ST right way up again and carefully wriggle the top cover off, if it sticks on the disk eject button you should have removed the disk before you started. Now firmly, without tugging, grasp the keyboard wires as close to the plug on the board as you can get, ease the keyboard plug off and put the keyboard to one side.

Undo the screws at the disk drive connector shielding and remove it. Now remove the disk drive screws, but don't drop the drive!
Nearly there. Undo all the little screws on the shielding. This is where the STe really differs from the STFM IMHO ;-) At the power supply, if no-one has been here before you, there is one screw which you cannot undo or even see. First remove the power supply shielding. Then the two screws holding the front legs of the power supply unit onto the motherboard. Now check you can't see any more screws around the perimeter of the main shield, you want all the screws off. OK?
Using a flat screwdriver under the front part of the shielding (under the bit the keyboard used to rest on) gently prise the assembly away from the lower half of the plastic outer case. When you can get your fingers in, dispense with the screwdriver and use them instead, but be careful you don't want to crack anything.

With great care separate the assembly from the lower case then place it down before you with all the sockets on the back facing you. Now right there between the on-off switch and the mains socket is the B#@$%*! screw that could have caused you a lot of anguish. Undo it and hurl it clear across the room! You can now use the pliers to straighten the bent tabs which hold the two halves of the shielding together, open it up and you're in.

Oh, and put the lower shield with the mother board back in the bottom half of the case, it's much safer there.

Reassembly is of course the above in reverse, except for that bloody screw, leave it out man you'll be back!

Sad to say but Omen is probably a dead duck! It's aim is a uniform operating environment across many machines (hooray) but the implication is that it will not run any application available for these platforms (boo) - any applications have to be re-written to Omen interfaces.

It's like everyone agreeing that peace and prosperity is a good thing -no argument! The problem is making it happen.

BTW, I got Omen up and going on my set up. The differences were that I had an HD (probably not vital) and a mono monitor (perhaps Omen is only targetted at this res.). Try it again with a mono emulator running.

The problem you're having with GEMview is due to the fact that you haven't registered the program. After a while of using the unregistered version, the program cripples itself by not allowing you to load or save certain file formats.

It was a price for a beta (a little buggy) release (300 zloty = 130$). The
price for public release with some new gadgets shoudn't exceed 160$.

: for life. People that are here tend to like playing about with and
: upgrading their computers, whatever flavour they are. Many, many people
: just want something they can plug in and use for several years without
: changing anything. They may not be very adventurous in their approach,
: but that does not make them wrong.

Amen. Since I started this thread, I guess I should wade back in. The
main point I was making does not apply to most of you who are reading
this. By your very nature you are in the lead in using computer
applications.
BUT, as the above post indicates, there are a huge number of people
who are not technophiles. Remember, the majority of people who buy VCR's
do not bother to figure out how to set the time and program them.
Basic word processing, spreadsheet and data base needs have not
changed in the past 5 years. You would think that someone could get it
right by now.
There is no need to upgrade your hammer or your four-function
calculator, and there is no need to upgrade something which writes
letters, does a few school, committee reports, etc.
For the very large number of people whose needs are not above
basic, the ST, or any computer they can comfortably use, should suit
them fine for the foreseeable future in these basic areas.

This is not to say that powerful programs should not be used!
Wonderful presentations and heavy duty work are necessary in many
fields, and especially in business. But more power almost always
means more complexity. The power needed for business applications leads
to a complexity level inappropriate for most home use. This is why I
said bringing a networking/business level operating system in the home
was a "waste." That statement should be stronger, in fact. For most
people it is harmful and leads them to give up on using their computers.
For the people who don't set their VCR's, being intimidated
into buying the latest computer is exactly the same as their being
intimidated into buying a new car to keep up with the Jones. This is
what MS and Intel excel at.

Now some of the objections brought up to the ST (Falcon, etc.) as a
home computer are valid. It would be better to take files directly to
work. Of course if a faster processor is available it should be used.
Without an adequate user base, CD's and home type software would not be

configured to work with this machine. But my point is there is such a base...it has just been swamped by big money big business.
Having a machine hard-wired for basic applications WITH the additional ability to load other applications from software...is also a powerful idea. The GEM/TOS system is far easier to use than any other operating system and this is its main advantage for it being a home computer (rather than stripping down MS-DOS). The larger point, however, is that for many home users, bringing a business level machine to the home and constantly upgrading it is totally absurd, a waste of money, and does not meet their needs.

"Pascal V. Calarco" <calarcop@medpo1.med.yale.edu> writes:

>SCSI drive, but all I can seem to find these days are SCSI-II, SCSI-Wide

It's no problem at all to use SCSI-II drives on the Atari as long as they
don't expect the bus initiator (i. e. the computer) to have its own SCSI ID.
(This is called initiator identification.) Some Quantum drives, e. g. Empire
and Fireball, expect initiator idenfication. You can't use such drives on
the ST. For TT and Falcon you need a hard disk driver with initator
identification support like HuSHI or HDDRIVER. In this case the drive will
work but you cannot boot from it.
SCSI-II is never a disadvantage if you have an Atari. It's always an
advantage because it is more standardized than older SCSI standards. And it
is compatible to older standards.

The Atari boots from the first drive that has an executable root sector.
It doesn't need ID 0 to boot from, any other ID will do as well.

I've been using htree different types for over six months now. Haven't
got the precise details to hand, but 2 are little Goldstar three
chips, about half an inch high. Number three is a Hitachi 8 chip, also
half inch (bought as a pair). Just to experiment I installed number 4,
a Seimens 9 chip, bought cheap. That bugger is nearly an inch and a
half high. No problems as yet (he says grasping the nearest piece of
dead tree!)

Argh,

does this 'demo on vga' shit NEVER ends?
Can't you just face that it's techinically impossible to make
certain things with VGA monitors that RGB can cope with?

And now demos that has synchro-dsp code are beginning to appear, Which
COUNTS on that the CPU has 16mhz (normal Falcon) and RGB mode. If not -
crash. If you want to see the demos _so_ badly that you have to post here
forever and ever, go buy yourself a secondhand TV (cheap) and look at
them instead.

Unless you have a 68030 *and* FPU then you won't be able to run Linux.

> System Solutions CD because is to expensive (Infomagics destribution
> of linux for the PC costs $50 and brings four CD's)

I installed Linux onto my TT from the March Infomagic set. Apparently there
is some newer stuff on the August one. You will still probably need a mew
kernel.

As for a Linux FTP site then tsx-11.mit.edu(?) is probably best - though
I have trouble getting all I want without a fair bit of searching.

For something that runs on a 68000 based ST, try MiNT. Its pretty good -
and I still use it on my TT from time to time.

:-)

Roland.

> If you destroyed that, you could pick up the cloak from the debris.
> (With the special device, don't remember how it's called)
> I don't know if the ST version is the same. I've never played that.

I think it is the second (or third) mission - kill the ship and collect the
device if it is lying around after. Go back to a saved game if it isn't there
or you clumsily destroyed it after the ship (like I tend to.. Die Die Die...
Opps).

I think the collector things are the fuel scoops.

A cheat - save the game on a disk and then take knifest to it.... one of the
bytes is a flag to say have got the cloaking device. (It is nice to have some
spare missiles too... even if the display is wrong)

Put it on a soft towel or clean paper, upside down. Remove the screws in
the square holes only; the other three or four hold the disk drive in
place, and you may not need to loosen this. In some cases, the screws at
the front of the keyboard are shorter, so set them aside, because if you
use the longer ones in front when you re-assemble, the screws will poke
through. Flip the ST back rightside up, and pry the sides loose from
around the disk drive as you pull gently upward. Use pliers to straighten
out the tin tabs which hold the shielding shrouds in place.
Good luck on your great adventure!

: Mr. Maddog

Hey Maddog, whats up Eric,
The Virus thingy is old news now, and anyway dident they also print a
retraction and admit to being fooled, not something a lot of people would do,

STARIOLAND yes a rip off, BUT at least its a release, some people like
it even if you AND ME dont, theres even follow ups in the pipeline yuk!,
but at least they will be releases, saying better no release than this
stuff would be going over the top, I have seen a lot worse ?
As the writers of Atari World are sending out messages of doom and
gloom regarding there own magazines life expectancy then we may be back
to the situation where we are left with STF again, notice how the others
come and go but STF are always there, most people are of the opinion that
STF has improved in the last year,

ST Format now boast some of the top writers on the Atari scene, they do
know what they are talking about, lets give them our support :)

These are my opinions on the "debate"

Cheers.....!ynoT Catcha on irc maddog hehehehehe

Don't bother with it. It was a novel idea, but with microsoft in the
market, it never took off. The interface is very ugly, and despite the
fact that it's a few years old now, I've yet to see ANYTHING with
reference to it, other than the Omen package itself.

It sounds to me like you are formatting a HIGH DENSITY disk as DOUBLE DENSITY.
You shouldn't do this because the HD disks are physically different than the
DSDD disks. Always use DSDD disks when transferring files from the Atari to
a PC.

Sounds OK to me! BTW, in what way would this procedure constitute a
problem? Isn't this the way "all" printing is normally done from compters.
Generating a bitmap, either within the printer--for example any apple
laser printer--or in the computer--which is how printing is done to the
Atari SLMs? If I understand you correctly then the Mac NVDI would only
introduce an intermediate bitmap stage. Speed, however, could be a
problem. It takes ages to print to the Mac printers from my Soft Windows
setup.

Why is it all the different ways of running X windows on an Atari can only do mono, as opposed to colour?
We now have Mint, Linux, and NetBSD that I know of and none of them do colour.

Is it impossible to do, (unlikely I would have thought) or is it in the process of being done now?

It doesn't have to be millions of colours, just 16 would do... :)

>Any info about taking my ste apart will be greatly appreciated.Thanks
>in

I *definately do not* recommand doing this unless you have experience of taking electronic stuff apart. There are some points where a measured amount of brute force has to be used - not enough and things won't budge - too much and things break. Also, the first time you do it, there is the added complexity of not knowing if you have removed all the screws or straightened all the tags.

Top Cover & Keyboard

All the screws for taking the top cover off are underneath. Three of them are long (a couple of inches or so) - do not remove these yet.

Unplug all the leads, turn the machine upside down, leave the power switch in the on position and take out all the small screws.

Hold both halfs of the case together and turn it back up the right way. Grasp the left hand side of the top half of the case and pull it off. The disk drive side comes off last and you may have to push the eject button in.

Next comes the keyboard. Lift it up on the left and stand it on its right hand side end to avoid straining the keyboard connector. Pull on the connector and it will come undone. Put the keyboard upside down on its keys.

Drive Removal

The disk drive has a cover. Remove the screws holding it and remove the cover to reveal the connectors (power and data).

Slide the machine over the edge of a desk then undo the three long disk drive screws from underneath. There is a (usually gold coloured) metal pin sitting where the non existant fourth screw would have been. Remove it after the drive is loose.

You will probably need a thin screwdriver for the power connector because it locks shut. Use the screwdriver to free the connector gently.

The data cable is usually a pain. You have to slowly ease it out by waggling it side to side without putting undue strain on the ribbon cable.

Power Supply

(don't bother unless necessary)

Remove the small screws holding the cover. There may be twisted metal tags that require straightening with a small pair of pliars before it will come off.

Some machines have a screw near the switch which can't be got at. You need to remove the motherboard to get at it.

The power supply itself is held down by four feet, the front two have screws in them. Undo them, use the small screwdriver to release the notch in the power cable and unplug it.

Motherboard

(don't bother unless necessary)

Go round the edge of the metal shielding removing all the screws. The whole motherboard and shielding should lift out. You can now get at that silly screw near the power switch.

Straighten out all the twisty tags. The top shielding on the motherboard should now lift off.

Reassemble in the reverse of disassembly.

He said he was _copying_ 100Mbyte. With verify on, that would mean that
the computer would have to read everything twice and write it once.
3 * 0.83 = 2.49, which is close enough to 3.1 considering the additional
overheads of writing and verifying.

: : >Anyone know if the DSP POV project is still going and what has happened to it ?
: : >(if there ever was a project 8-)

: : I hope there is a project and I also hope that we gonna the result in couple of weeks ?
: : Would be interesting to see POV scenes rendered in "few" secounds.

: Actually, I think I got this mixed up with FTPOV (faster than pov).
: I havn't looked at the source code for pov - maybe it wouldn't be that hard
: just to put a few simple things into the dsp, matrix multiplications for
: example, or simple but very iterative functions.

Who's gonna convert the floating point routines (at least sqrt,
maybe a couple of trigonometric functions too, in addition to the
+,-,*,/) to DSP code??? That would probably need _much_ more
coding than just converting the raytracing math (eg. Intel got
that FDIV bug quite long before it got fixed :).

Using fixed point arithmetics with raytracing would not work well
enough (especially if the scene has a lot of reflections) due to
the rounding errors I think...

I have two multitimbral midi keyboards on offer ;

1) Yamaha PSR51 portable "mini" workstation, 61 mid-size keys, AWM voices and PCM percussion, 16 part multitimbral, 28 note poly, touch-sens via midi, built in sequencer, drum pads, sfx pads, sophisticated style backing system, pitch bend, soft carrying case, built-in spkrs.

Offers around ï¿½95...

2) Kawai K1 synth, 61 note full-size velocity and pressure sensitive keyboard, mod & pitch bend wheels, joystick vector controller, 8-part multitimbral, 100's of new sounds on disk, also comes with DC8 RAM card to hold extra banks of sounds. Great sounding keyboard synth....

Offers around ï¿½300....

Plus... free midi sequencer for Atari and midi cables to go with either!

Email me if interested,

spesgw@cf.ac.uk

>smaller each week, if you have ideas - tell her!

Ian,

Thanks for reminding people about feedback. As a long time ATari computer user, it saddens me to see the computing section grow smaller and smaller over time. While it's not a surprise, it's still disheartening. Our Atari computing support staff is quite small also - only two of us really doing the work these days. With most of our time being spent online keeping up with the online community and working on our respective sections, it's difficult to do up original and "intensive" articles that we'd like to do - hence my request for feedback and other input.

BTW, "her" is a he - something my wife can verify! <<vbg>>

2717. WTD: English CLI for MagiC 2.01

Newsgroup: comp.sys.atari.st
Date: 1995-11-28 00:00:00 UTC
From: ppospis@mtroyal.ab.ca
Message-ID: <1995Nov28.084846.33@mtroyal.ab.ca>
Source record: 155601

Is there an English CLI that will work with MagiC V2.01?
Everything I have seen is in German, which excludes me.
Thanks.

2719. WTB : Cheap hard drive for 1040STf!!!

Newsgroup: comp.sys.atari.st
Date: 1995-11-29 00:00:00 UTC
From: grendel@bluefin.net
Message-ID: <grendel.56.0012E956@bluefin.net>
Source record: 155454

Hello. I'd like to buy a small (read : low cost) hard drive setup for my Atari 1040STf since i'm sick to death of swapping disks. I don't want to spend more than 40 dollars total for it unless it's really worth the extra money. All I need is like a 20MB hard drive and some type of controller to drive it in a case. I've heard that Atari's old Megafile drives can be hooked up directly to the "hard drive port" on the back of the STf, so if anyone out there has a Megafile20 or something similiar for sale, please let me know!

So long, and thanks for all the fish!

From: vgriscep@wam.umd.edu
Message-ID: <49impq$guc@cville-srv.wam.umd.edu>
Source record: 155455

I'm fairly new to the ST, but it didn't take more than a few seconds for my jaw to drop at its graphics. Anyway, I got my first addictive game for it (I'm sure many more will follow): Time Bandit. I can't remember the manufacturer off the top of my head, though I know it starts with "M"; and I remember the copyright date being 1985. Anyway, I'm finding that I'm stumped! I can go everywhere, get lots of treasure and all, but I can't find a single object! I don't want a solution to the game (what fun would it be if I had all the answers handed to me?); I just want to know, are there any controls other than the joystick that are used when there is no text prompt? Is there, say, some way to bypass the "WAY OUT" icons? Are there codes of some sort in the instructions intended to prevent piracy (a la Oxyd)?

>What are the specs then?
AFAIK the Hades-developper is Fredi Aschwanden (the Medusa-dev).
The Hades is the first PCI-based-Atari-clone with a 68040-processor running
at 33/66 MHz.
The price will be around 3500 DM; I think thats not cheap, but at least 2000
DM cheaper than the Medusa...

Posting Tos binaries between PC users is perfectly OK. Zipped for preference, they unzip pretty fast on 486+ boxes. Then copy to 720k Dos floppies (see copious correspondence on this matter in this group and c.s.a.st.tech). In fact you could do your friend a favour and get the software (RS232 patches, Teddyterm or Connect terminal programs etc) to get her started.

Source record: 155463

Just a little something I noticed the other day. You may know already, but
what the heck...

As you know, when you install WinX, you get a little box appearing +---+
between the scroll buttons and the scroll bar itself. You'd also | ^ |
know that when you click on the scroll button, it's the bar that |---| /_
depresses instead. |---| \
| |
Now, what I found the other day, is that if you HOLD the mouse | |
button down, you can move it around the small box, to move in
ANY direction whatsoever. Up, down, left, right, even diagonally.

Quite handy when the other scroll button is hidden behind a window :)

Cheers,

Neil.

: It sounds to me like you are formatting a HIGH DENSITY disk as DOUBLE DENSITY.
: You shouldn't do this because the HD disks are physically different than the
: DSDD disks. Always use DSDD disks when transferring files from the Atari to
: a PC.

: -Michael Ellis

Actually the Atari ST does sometimes write to track 0 (the bootsector).
Thus can be for a number of reasons, mainly the Ghost virus can be
present and a virus protector has been put on the disk. Both of these can
have the effect of making the disk unreadable in a PC.

If the Ghost virus is present, then you will not notice this necessarily
whilst you are copying or moving files, but all of a sudden the PC will
refuse to recognise the disk.

Basically, to protect your disk from viruses, check before you put this
disk in, and do not put any protection on it.

P.S. Obviously you cannot transmit viruses between the two machines.

Chaz.

Oh yeah, I knew this was the right place to post my request. Thanks by the way for your participation. I did never believe though to get such a tremendous response (leaving away the guys telling me how stupid I am). Ok. I've been reading about 22 responses telling me how to format my diskettes to make 'em readable by both. But figure somebody having to convert a bitmap or gif or some other binaries. What is he going to do, once he HAS formatted his disk. Are you guys going to tell me, there are no conversion tools or anything. All I heard now was about copying ASCII-Stuff.

Thanx again, hope for more Ralf

Eric Hays (szhays@chip.ucdavis.edu) wrote:
: Sounds like a ton of cool stuff was shown at this show. Could someone
: who attended clue those of us on the other side of the planet in? What
: new software was shown, what software has been upgraded (Magic 4.0?,
: Papyrus 3?, TOS 5?!), what new hardware is there and how do they spec,
: how much do they cost (Falcon eXtetension, SpeedUp, Hades, etc...)

The show lots of interesting software and hardware.

Hardware
=========

Besides the Medusa, the Hades was shown, a 68040 system with PCI bus; due spring next year, about DM 3000; worked very well; the Afterburner was shown, Speed improvement as comared to standrad Falcon enormous; was presented in an open case, because it wouldn't fit into the original case; C-Lab showed their Falcons, including a model of their new Falcon product, which seems get the Falcon into a very pretty, case similar to that of a VCR.
As I have a Mega STE, I was not that interested in those products; I do not think the afterburner was sold
A new grpahics adapter for Pc cards was made available for PAK owners, so ET 4000 and Mach64 cards can be used directly
Ans---tons of Macs running magicMac;

Software
=========
Magic 4.0 was sold; the updated Magic operating system runs now on the Falcon, too, and provides witha truly excellent new Desktop supporting all new features, newly styled GEM windows (remind me of Mac), improved AES with integrated Fontselctor and newly made fileelector; the installation rotinme seems soemwaht buggy, as many Falcon and Tt users had problems installing it and had to do some changes from hand; otherwise the system runs very well
Competition, however, is on the way; Overscan presented N-AES, a full multotasking AES for Mint, full AES 4.1 compatible with additional features (such as the abiltiy to switch the menu bar off)- it works very fast and supports Mint fully (AFAIK including memory protection; it will be delivered with Mint and Thing; price DM 99, dor NuktiTOS users as an upgrade almost half the price
ASH sold the new TEXEL, CCD showed an improved Tempus WORD, Version 5.0 beind due in Fevruary and should blow off all what has been seen on Atari texetseystems up to now; till then, Papyrus will be number one; version 4 was on the show, looked great and will be delivered within the next weeks (with money back guarantee); a new image processing system hit the

streets, called PhotoLine, it should be superior to allcthe existing
image processing systems.
I hd not enough time to look at everything, but I got myself quit apile
of software (I am .workinh right now with Magic4);
oh I almost forgot: NVDI 4 was sold; it could do UNICODE, had small
additional features, such as a module for Type 1 fonts and a utilty to
mange all types of vector fonts, even if not already installed in the
system, other highlights were font installation on the fly and faster
vector text output

Come one! Come all!

The Atari Bay Area Computer Users Society (ABACUS) will be holding their big 1995 auction this Saturday, December 2, 1995 at the Potrero Branch Public Library in San Francisco, California.

We have lots of great hardware and software to choose from. So come on down and place your bid for that hard-to-find item that we just may be auctioning off!

The Potrero Branch Public Library is located at 1616 20th Street in San Francisco, CA. The auction starts at 1pm and lasts to about 4pm.

Need more information? Please call one of the following phone numbers:

ABACUS Online! BBS: (415)564-8062 (data) (8N1 300-14.4K 24hrs.)
Roger Sinasohn, President: (415)469-7924 (voice)

See you there!!

>coding than just converting the raytracing math (eg. Intel got
>that FDIV bug quite long before it got fixed :).

Motorola has got a floating point library for the DSP 56001.

>Using fixed point arithmetics with raytracing would not work well
>enough (especially if the scene has a lot of reflections) due to
>the rounding errors I think...

I think it will work quite well with 24 bit accuracy. Define the
"universe" as a unified cube and put the camera in the middle of
one of the faces. A 1024x1024 screen rendered with 5 bit accuracy
(e.i. 32x32 possible samples) per pixel will probably be enough.
Thus, the "size" of the universe will be 512 screens next to each other.
(2^24/2^5/1024 == 512)

/Noring

Not quite so. AFAIK it is the HD drive which differs. The read/write
heads use higher current in HD write mode.

q> Always use DSDD disks when transferring files from the Atari to
q>a PC.
q>
q>-Michael Ellis
q>

If you need this kind of file transfer you must have access to both
machines, I would endorse the above adding format the disks on the PC
first. I even keep a box of ten disks on one side solely for file
transfer purposes Tos>PC and PC>Tos. They're not expensive.

This sounds very interesting. Can someone translate this to dollars? I sometimes feel that there is still a niche market out there for the hobbyist but only if the prices are reasonable. I would like to see inexpensive TOS compatible motherboards developed that would fit in standard PC cases and use as much standard components as possible. Then stores like Toad Computers could begin to sell custom built TOS compatible computers using standard off-the-shelf PC parts (cases, power supplies, SIMMs etc)

2743. Megatraveller questions

Newsgroup: comp.sys.atari.st
Date: 1995-11-29 00:00:00 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <DItGnv.98u@freenet.carleton.ca>
Source record: 155478

Hi! I've recently gotten into an older Atari Space rpg, megatraveller 1, and have some questions for the great gamelords of the net:

1) Is it just my copy, or is travelling from planet to planet very difficult? I have the correct programs running (maneuver, nav, jump for jumps) but only see little coloured dots in the upper right corner of teh screen. Finding the different planets is a real trial and error!

2) whenever I manage to dock at a star to use the fule scoops, the game tells me I'm at a planet, won't let me refuel or land!

3) I have tried out a few missions, and either do not find the erquired item on one of the bodies, or have the game crash when I go to leave a building.

4) the game crashes in some of the shops

Other than this, it is a great game! I really like the combat system, especially once you pick up soem weapons like the PGMP. Has anyone actually finished this?

Well, Not sure about JROFF_3E.ZIP

But, There is j_office.lzh (not sure of the Version number) Dated 15 Feb 95
which you can get through: http://micros.hensa.ac.uk in the Atari Section in
Software for TOS under Communications Software

Note : This is copied off of their main screen:
The HENSA/micros service will be unavailable on Thursday 14 December 1995
due to a major software upgrade.

We will be replacing the existing operating system, SunOS 4.1.3 with
Solaris 2.4. This is mainly to allow for future hardware expansion.

We expect that the machine will be unavailable for the whole day and is
not guarenteed to be back in full working order until 12:00 noon on the
Friday.

Hope this may help a little.

CE> My system is a 520STfm with 2.5M memory,

This config is a bit of a red flag. I have a 1040ST with a ZRAM 2.5M upgrade. It needs some new chips, which may help, but I was told by Bob Luneski at Oregon Research that Atari never really supported 2.5M. Could be that some of your DA's and/or auto prgs don't like it. The ZRAM also had trouble staying connected - you may want to reseat the board.

2750. Getting files to run...

Newsgroup: comp.sys.atari.st
Date: 1995-11-29 00:00:00 UTC
From: ldickey@west.cscwc.pima.edu
Message-ID: <1995Nov29.215958@west.cscwc.pima.edu>
Source record: 155485

Hello all-

I need help trying to get my Atari 520 st online.

I ftp'd to wuarchive.wustl.edu and downloaded a file called starter.tos.
It is suppose to contain porograms that allow one to unpack (uncompress)
programs that are archived with .lzh and such. When you copy the program (to
another disk or directory, I assume) the program is supposed to unpack itself
and all the files are supposed to be listed, unarchived, into the TOS
directory.

Sounds easy enough.

Unfortunatly, I haven't been able to get the programs to come up at all. When
I do copy them, as the instruction text indicates, it appears that the computer
is copying something to the other drive, but after all is over, nothing seems
to materialize on the diskette. Just the archived file starter.tos.

Is there something else I need to do to the file in order to get these programs
unpacked and onto my disk's directory? Is there a parameter I need to specify
in order to get this file to run on my system?

I was thinking that perhaps the problem lies in how I'm downloading the file.
Since I don't have the st up and running on the internet as of yet, I have had
to download the file using an IBM ps2 at my school. It seems to get the
program seemingly without incident. I was just wondering if there was some
type of quirk in the st's (or ps2's) drives that is different from regular
ms-dos machines.

I was also thinking that I need more memory to run these programs, as well.
My current system is a 520 st, two drives, and, I assume, 512k.

If someone can help me, I would greatly appreciate the effort.

Thank you-

loren dickey

I agree, where is jroff_3e.zip. I followed someones kind advice to get the HENSA directory and 800k later I still don't know where the program resides at HENSA.

I found alot of other interesting stuff so I don't mind but I think that in the interest of fostering community and preserving bandwidth, not to mention reducing my blood presure, someone who knows the location of said program could point the way for the great unwashed rather than advising people to get a directory.

Oh, by the way, anyone know where I can find jroff_3e.*?

It certainally works fine with NVDI (doesn't everything!?) not sure about the
other two though. I use Hsmodem 6 which IS the best comms port patching
software, as far as I know then Modem.Cpx is comeletly un-necessary as I have
never used it once and the modem settings are contained at the begining of the
Startup.Nos file. I really don't think that Oasis has much to do with this
problem as it just does the off-line stuff and can launch NOS, if I understand
correcly this is as far as it goes. I take it you have something like a get_ip$
line or something in your Dial.Txt?

LHITM<>Have you heard anything about the new Falcon compatible Magic 4? I
LHITM<>would realy like to get some feedback about this :)

Yes, it is reality. There have been a lot of users who bought it and who discovered two minor problems. You couldn't use Magic4 without an IDE-harddisc on a Falcon (problem is fixed now, which means that the version you get now also works with SCSI only) and the second "problem" is that you get Magic on a HD disc (DD is also possible but only on demand).

Tschuess Frank

P.S.: It works fine and it is fast

But we don't want to make it tighter! Put all the texts into files,
and read them from there! Character-by-character (each time opening
the file, doing a seek for one char, and then closing it). Copy
everything at least three times before using it. Then translate
everything into p-code, and interpret it!

Tight code doesn't sell pentia ...

Bollocks. The initials PC (capitalised) may have become associated with the IBM PC architecture, but a personal computer (lower-case) is just a computer for personal use, as opposed to a shared facility such as a server or mainframe or whatever. All my Ataris at home are personal computers, as are the two machines on my desk at work (an ITT XTra and a VAXstation running VMS :>).

Does anyone know of programs (source or executables) on both ST and PC
that make it possible to use a PC's harddisk from an ST?

Thomas Duclert (tomduc@micronet.fr) wrote:
: Hello, I am looking for a software to read Atari's 520 ST floppydisk on my
: LC Macintosh.

The Atari disk format is identical to the DOS disk format. (There was
a small gotcha in TOS 1.00 and TOS 1.02 - those TOS versions formatted
disks in a way which confused some DOS clones which did not adhere
fully to the Microsoft standard for reading disks.) So what you need
is a tool to read DOS disks on your Mac, and I am told there are
plenty of tools for this purpose - although I cannot name one, since
I don't own a Mac.

From: markvanwyk@aol.com
Message-ID: <49gv1c$7jc@newsbf02.news.aol.com>
Source record: 155532

For Sale:
Mega STe w/4mb RAM, 50 mb HD, 1.44 mb built in floppy, TOS 2.06
SF314 750k external "B drive" floppy
Spectre GCR 3.0
SM124 B/W monitor
SC1224 color monitor
AB monitor switch
Olympia Compact RO daisy wheel printer
SX212 1200 baud modem
Lots of software, including WP, MIDI, and games, including receipts, box and docs. Everything works great.
Sunnyvale, California
Buyer pay shipping, COD.
Someone offered me $400 (but never came through). I'd consider something in that ballpark. I might even pay shipping, if someone really wanted the system. Couldn't hurt to ask. I WILL NOT SPLIT UP THE SYSTEM AND SELL INVIDUAL COMPONENTS. (People usually only want the really good stuff for a cheap price). Interested? e-mail:
markvanwyk@aol.com
or call me at

>
> I can't send files using z-modem.
>

The most common reason for failed uploads is (the lack of) RTS/CTS flow control. Information is being sent to the modem more quickly than the receiving host can process it, and the mechanism to tell it to stop for a while is not working. This can be caused by several factors:

1. Make sure only RTS/CTS is selected in the communications settings dialog. If you use the autodialer, make sure it is chosen in the "C" button to the right of the appropriate autodialer entry.

2. Nearly all versions of TOS have some sort of bug with respect to RTS/CTS. Use the SERIALFX2 program that is on the STalker disk in the EXTRAS folder, if you need it for your version of TOS. More info about this is in the STalker README file.

AFAIK, you can use HSMODEM also. I tried it myself briefly and it seemed to work fine, I have also had other people tell me it helps things significantly. The thread here is the first I've heard of problems using it with STalker.

3. The modem may not be set for RTS/CTS (what they sometimes call "hardware") flow control. You will need to look in the modem's manual to find the correct AT command(s) to send, since this varies from one modem to the next.

If everything is configured correctly, you will probably see the modem's RTS/CTS lights blink as you upload (if it has them).

q>second at 38400bps,

Haven't heard that one about losing a character. Seems to work ok.

q> and that one needs to program a chip for the rsve. Which one is
q>the most expensive, reliable, easiest,...?

Undoubtedly 38400 is the easiest and if you use HSMOD it works well.
RSVE appears to use a programmable micro controller (PIC) that's not too
bad, getting the bloody thing programmed is another matter if you lack
the necessary hardware, that's why I chose 38400. Also I haven't got a
28.8 modem so it seemed a bit pointless.
Incidently, don't look too hard for missing characters, I use this lousy
PC at work for Internet. I use the STe for BBS.

Just because it had little of interest for you doesn't mean is is
a piece of rubbish. For anyone interested in programming, ST Format has been
quite strong recently with several programming courses in different
languages. If you think it really is so crap, maybe you should have created
those files you needed yourself, and felt really good about the fact that
you didn't have to get ST Format to do it for you. No-one forced you to
buy it.

Re: WARNING about disks becoming unreadable
on the PC. I've had the same problem, but have
noted that I was trying to Fill the disk to maximum!
As long as I leave 20k or so free when writing to
the 720k DSDD disk formatted on PC, with the
Atari, I don't have a problem any longer! Atari
does 'mess' with the FAT on the disk, I think
because PC and Atari both come up with a
different amount of 'free' disk space, so they
collide when you get close to max!

Hope this helps!

Now that I look back, I'm sorry I compared the whole issue to that one game.
At least you get a chance to play a demo before you actually buy the
game, if you hate it you don't buy and no money is wasted. What I did
get from the recent coverdisk are the MIDI files which helped me alot in
a project I'm doing for school. And after reading about using Multimedia
on the ST, I'm giving my presentation Hypercard style with Hyperbase.

> As the writers of Atari World are sending out messages of doom and

ST Format is just about the only Atari magazine out there(that still
supports Atari machines at least). I hate to see them go away. It's
upseting though to see "less coverage" because of the ST scene itself.
Right, so I either yammer about how lousy the ST field is getting or I
stay in to support it so it can get better. Since I can't afford any

other computer right now, I better get the most out of my ST :)

Moez BENSAIED (mbensaie@jonathan.ensem.u-nancy.fr) wrote:
> Does anybody know how i could copy a whole floppy disk in to one big file
> containing the bootsector etc.......

This sounds very much like a program i have been writing for the last 18 months.

Originally it started out as a background disc formatter for MultiTOS, but has now grown to include copying discs (to other discs and to a big file on the hard drive), verifying a disc to ensure it's reliability, and comparing two discs.

Among it's special features are:
- Variable priority (settable by the user at any time)
- The ability to work within MultiTOS with protection 'on'
- Can cope with nearly any size disc
- Seamless integration with the MultiTOS desktop

It currently needs GEM AES 3.3 or better (as found on the Atari Falcon). An ST or TT with MultiTOS would also work. GEM replacements such as Geneva could work if they supply AES 3.3 or better features, but I have been unable to verify this.

Unfortunately, at the moment i am not able to distribute it, as I have been informed that I have violated someones software patent, and am furiously rewriting it to get around that problem and to further enhance an already great software product.

If anyone is interested, i have spoken to the (very elusive) local Atari agent, and he seems interested in distributing it.

(Given the fact that it has cost me the better part of 700 hours writing it, and over twice that researching/testing it, I doubt it will be as PD/shareware. But I am open to suggestions. Do you think I should change my mind? If you were to pay for it, what would you consider reasonable?)

: : no, I think not, the price is WAY to high!
:
: Considering what the compuer does in performance etc, it is at a nice
: price... competing directly with the Mac and the PC. I saw it at
: ProTOS and I was well impressed. :-) Maybe I will buy one when it is
: available in England.

It's kind of funny how Microsoft and The Boys have brain-washed even us.
We probably all find ourselves sometimes comparing platforms by their
hardware, forgetting how greatly the operating systems and programs
really affect the REAL performance.

Every now and then somebody here asks: "Why should anyone buy a Falcon,
Eagle, or ... - when we can get mighty Pentiums and sexy Power-Macs for
same price!?". Well, I just used Microsoft Word 6 on a 68040 Mac Quadra
- and that was definitely the first and the last time!

68040 Atari in damn fast; I've seen Medusa T-40 in action... But, for
some reason, a 68040 Mac isn't fast at all. Word 6 was ridiculous;
the slowest word processor I've ever used on any platform. But then
again, Quadra never feels very fast to me - unless perhaps when doing
some CPU-intensive task, like packing.

Yes, we can certainly get the same performance using 68040 as Macs and
PCs get using P5 and PPCs, in almost every area. Raytracing is another
thing.. We have a compact and fast OS; no need for V12 engine when the
car is light and aerodynamic =) !

Let's hope Hades, Eagle and Medusa will sell well.

: Regards
: Danny

> : Sorry about that.

> Hi Elias. :-)

> If he buys a PAK030 for his STe he can run Linux very well.

Only if he also buys himself some extra harddisk space aswell !!!

As for the PAK030 , cheaper to buy a Falcon and keep the STE to play Games
with while he waits for the Falcon to compile the latest Linux kernel :-)

Source record: 155404

The subject pretty well says it all!

At some sites, the files are compressed in Unix(?) or something I haven't run into before; xxxxxxxx.tar.z (or .gz or zx etc.) How do you handle this stuff?

I tried Uncompress.ttp, but couldn't get it to work. I haven't been able to find anything on tar.

Can someone fill me in?....Please?

Bob

>company. What do you all think?
>

Brilliant idea. Now would be the best time, as Atari stock is under
$2/share.

BUT- It's not Atari that we want. Who in this newsgroup wants to buy
Atari? It's surprising that they were able to sell as many computers as
they did, considering that the vast majority of the world attributes the
company name to the 2600 VCS . . . Imagine if Nintendo created a wonderful
home computer with a proprietary operating system and custom chips. Who
would take them seriously? Not many.

What we need to buy are the rights to TOS and GEM. Then we could put some
nice fixes and updates to this system, place it in the midst of raw
horsepower (PPC604? 2MB VRAM; Fast I/O, etc) and have what we really want.
In actuality, this would be more reasonable, more economical, and a more
direct address to the problem. It would be easy to spread the word to the
existing Atari user base, and then (not so easy) attract other buyers. Or
at least cheaply license these to the existing clone makers (really good
idea!)

I assume that Atari has the rights to both of these, as Digital Research has
gone 'into receivership', and TOS was coded by Atari programmers for the
68000. Atari needs money NOW to concentrate on the console and software
markets, thus may be willing to negotiate. Probably not, though, knowing
their patent/license tenacity.

Oh- and we (or whoever) need(s) a LOT of money to start this company going
on the right foot. Any venture capitalists out there?

2791. Quantum Hard Disk & SH 204; REWARD!

Newsgroup: comp.sys.atari.st
Date: 1995-11-30 00:00:00 UTC
From: kirschke@ki13.informatik.uni-hamburg.de
Message-ID: <KIRSCHKE.95Nov30084328@ki13.informatik.uni-hamburg.de>
Source record: 155410

Hello World,

I'm just trying to put a 80 MB Quantum ProDrive SCSI harddisk ripped
off an old Macintosh into my SH 204 (from 1985). I connected the hard
disk direct to the `host adapter' of the SH 204, bypassing this
beautiful SCSI to ST506 adapter; when starting AHDI or HDX 5.04, the
hard disk is sensed as an `Quantum P80S 940-80-94x'. So I guess
selecting the drive, data transmission from/to the hard disk
etc. should be working (this message is sent from the disk to my
ST). The IDC formatter tells me the disk has 6 heads, 834 cylinders,
(very nice), but refuses to format the disk since I'm not using an IDC
adapter :-(When trying to format the hard disk with HDX 5 or 5.04,
both show me an error message after a while like `Can't write to
special sectors'.

My Question: What's going wrong? Is it the hard disk or the hard disk
============ driver? Has anybody tried similar? What hard disk
driver, formatter should I use?

My REWARD: Since your work is to answer my question, I will in turn
========== answer an (almost arbitrary complex) question from you about
one of the following fields: C, CLOS, LISP, GNU emacs, TeX,
UNIX, image processing, KHOROS, HTML, data bases,
do-it-yourself home working, cooking.

Sincerely, Heiko

It's less than $2 a share now! Howvere, so much of the stock is
held by the Tramiels and their buddies that it's doubtful you could ever
have any influence on their business decisions.

From: johnmoon@connexus.apana.org.au
Message-ID: <49ke84$21k@preeda.internex.net.au>
Source record: 155415

Hi Ian,

: 1) Whats an STFM? I can find no reference to this (I assume) submodel
: anywhere. Only STe, MegaSTs, and so on. I assume its some derivative
: of your standard ST.

The STFM enables you to connect your computer up to your TV if you so
wish. The STe is the "e"nhanced version. It has an upgraded operating
system.

: 2) Is C-lab Creator a good program? Can I actually do decent sequencing
: with it?

Creator is a great program, but the full version is called NOTATOR
which combines Notation with Sequencing in one package. The dongle that
you got with it will not allow Notator to run tho....only Creator.

: 3) I note that the machine has a hard drive port. Are hard drives still
: available, new or second hand? What sizes and speeds? Can you butcher
: (cheap) IBM equipment to the job? I'm in Melbourne, Australia.

Oh yes, with a SCSI adapator called the LINK2 you can connect up
SCSI2 HD's or Syquest Drives or the new ZIP drives.
Here in Melbourne, we have an ATARI club with a BBS, I am co sysop.
ANYTHING you need to know about Atari computers can be obtained
from the club or the BBS. With getting a good CHEAP scsi HD connected,
just email julian@connexus.apana.org.au tell him I sent you!!!
You wont get a better deal anywhere for Atari HD's ANYWHERE!

: 4) I see mention of various ROM versions, 1.0, 1.4, 2.X. Are upgrades
: a necessity, and if so, how?

Dont settle for any TOS (that is what Atari's OS is called) less than
1.4 get higher if you can.

: 5) What should I do with the beast now? :)

Join M.A.C.E. for a start, Full club membership is $40 per year with a
once only joining fee of $10, or you can join the BBS for an hour per day
for just $20 per year. I've also set up a GREAT online games area as well!
Dont feel as though you are on a desert island with your machine, there are
plenty of users in here in Melbourne that can help you out.

Melbourne Atari Computer Enthusiast's
P.O. BOX 340,
Rosanna, Vic.,3084
Australia.

BBS: +61 3 9772 7118

: Thanks for any help you can offer,

No probs!

: PS Ironic, I started my computing days on Z-80 machine running CP/M by
: DRI. Then I moved onto IBMs, where I had a preference for DR DOS, by
: DRI. I buy an Atari, I click on Desktop Info, and I find its running
: GEM, by DRI. :)

Well....youre due for even more shocks when you find out what the machine
can do 8-) hehehe.

WE HOPE TO HERE FROM YOU SOON!!!!

So is the problem converting GIF files or something into IMG or
something else used on the ST (GIF can be used as well in many
programs), or is the problem that you have TOS formatted disks which
you want to "convert" to MSDOS?
Both are possible. Tell me exactly what the problem is and I'll try to
help.

John Moon (johnmoon@connexus.apana.org.au) burbled gracefully:
: Ok, this is all quite simple if you know a bit about UNIX.

Unfortunately, Demon only runs slip/ppp services :-).

: For someone to get into your account blah blah they of course have to
: have your login name and your password. There is no other way!

Well... there *is* but it's fiddly.

: Telnet will allow them to completely control and CONFIGURE your net account
: however they want. FTP or NCFTP only allows file transfers.
: In both the above they either have to hack their way in or you supply them
: the details. For them to get into your home system...there is no way they
: can do this via the net. They must log into your computer directly while
: you have Connect (or any other term .prg) running.

Forget Connect, unless they're going to dial you up direct that is...

You'd have to set up MiNT and Mintnet on your Atari (I don't think the
FTP daemon built into NOS can handle incoming sessions, but the PC
version does afaik so maybe the ST one does). After you've spent 345
years setting up your machine then you can go along setting up the ftp
daemon for mintnet and setting it to allow anonymous ftp-ing to your
machine. When you've finally done all that you log on at an agreed time
and transfer the files.

It's much easier emailing them uuencoded to him or even using MIME. Or
using an intermediate FTP site to jump from...

Check the docs for MiNT/Mintnet/Mintos for details.

Cheers,

Paul.

Yet again Atari World is in the few shops which stock it, whilst us subscribers are left watching the letterbox. I would have hoped that, as they will be increasingly reliant on subscribers to keep this excellent magazine going, they might try offering at least a comparable service.

I didn't byu ST Format this month - thinner than ever, with the least inviting front cover I've ever seen. They must really be scraping the bottom of the barrel for editorial staff (with one or two notable exceptions) - how long does anyone give it?

Andrew, hoping to get his AW before Xmas...

From: martinna@cf.ac.uk
Message-ID: <DIuvHp.3qu@cf.ac.uk>
Source record: 155424

Robert Wills (cj439@FreeNet.Carleton.CA) wrote:
: > mono and I use cubase. Could someone recommend the best sequencing
: > software to use on a colour monitor please (preferable not under mono

: MasterTracks works in colour. So does Cubase's ancestor, Steinberg 24.
: Alchemie, Band-in-a-Box, Dr T's KCS, Edit Track, all work in colour.

Great. Thanks. One of those will do the trick.

BTW if anyone else was following someone mailed me direct suggesting
sequencer 1 (I haven't checked yet though).

Thanks to all who responded.

Neil

FTP over to Hensa (micros.hensa.ac.uk) and go into micros/atari/tools (or is it
tos/tools ?) and in there there should be a loads of programs for amost every
archive you could come across, for gz files you need Gzip, tar needs untar &
IIRC .z needs compress, not too sure about the last one though, check it out
it's a very good site.

Almost certainally not this as long as you are using DD disks.

>I was also thinking that I need more memory to run these programs, as well.
>My current system is a 520 st, two drives, and, I assume, 512k.

This sounds more like the problem. 512k is not a lot these days, you will
probably be given an error message when you load the executable file but because
of a bit of sloppy programming it exits straight away instead of waiting for a
key so you do not have any time to read it.

>1) Whats an STFM? I can find no reference to this (I assume) submodel
>anywhere. Only STe, MegaSTs, and so on. I assume its some derivative
>of your standard ST.

It is the pre-decessor to the STe (E=enhanced | FM=Internal Floppy & TV Modulator), it is pretty similar to the e but has less colours, no Dma sound or phono output sockets & no useless joystic ports on the side :-)

>2) Is C-lab Creator a good program? Can I actually do decent
sequencing with it?

Not really sure, I dont know about Creator but the C-lab stuff is generally VERY good and most proffesional sudios have used it at some time.

>3) I note that the machine has a hard drive port. Are hard drives still
>available, new or second hand? What sizes and speeds? Can you butcher
>(cheap) IBM equipment to the job? I'm in Melbourne, Australia.

Virtually any SCSI hard drive will work as long as you buy a Host adaptor such as the ICD Link 2 which is widely acclaimed as the best one around. There are problems with some Quantum Firebalkl drives though so be carefull.

>4) I see mention of various ROM versions, 1.0, 1.4, 2.X. Are upgrades
>a necessity, and if so, how?

Tos 2.06 is the only one widely available and it is not necessary but is is a very welcome addition to my system to have edited icons, more windows, keyboard shortcuts, drag & drop launching, icons on the desktop, standard partition sizes of 32mb rather than the 16meg of 1.0 & 1.2. You can go way over these limits though using more sectors per cluster and have massive partitions of something like 512meg (or at least 256meg, not too sure!) so it is not a massive restriction but it is more efficient.

>5) What should I do with the beast now? :)

Whatever you want! There are loads of ftp sites and still a lot of commercial stuff floating about it can do virtually anything you can throw at it.

>Thanks for any help you can offer,

You won't be able to run Linux on an ST unless it has a 68030 processor built
in, e. g. a PAK card. Linux requires an 68030 with floating point processor.

2811. Lottery Companion 3 Available. UK National Lottery Program.

Newsgroup: comp.sys.atari.st
Date: 1995-11-30 00:00:00 UTC
From: Mark Butler <Mark@dwell.demon.co.uk>
Message-ID: <244730920wnr@dwell.demon.co.uk>
Source record: 155430

Lottery Companion 3 for the Atari ST, STE, Mega, Mega STE, TT and Falcon is now available.

Note UK National Lottery Only.

It has been uploaded to Hensa - But the last time I looked it wasn't available for FTP download.

In the meantime you can download from the following BBS's

All At Sea BBS : 01203 601448
Fortress BBS : 0181 244 9825
STandard BBS : 0139 427 1550

All are well worth a visit anyway.

Failing that a Disc and Stamped Addresses Envelope to 8 Brookside, LE10 2TL (UK) will get you a copy.

Or most PD Libs will also have it.

Lottery Companion 3 is Shareware from just Five Pounds.

Favourable reviews of versions 1 and 2 have appeared in ST Format and Atari World.

Any questions - Please Email me.

All the best.

--

Errmm ... sorry to ask this simple question but do you actually RUN
starter.tos (by double-clicking on it)? The simple act of copying it won't
make it run which is what it needs to do to unpack
itself.

Fl> I was thinking that perhaps the problem lies in how I'm
downloading
Fl> the
file.

512k.

This should be quite enough for a simple prog like this. The unpackers
themselves (LZH, ZIP, ARC) are only a few tens of Kb
each.

Does anyone know where I can get SUNDOG? I used to looove that game,
andhave since lost it. Any place still carry it new?

You know, its really interesting...some say that piracy brought down the Atari ST, some say bad marketing.
But as for the piracy nowadays, what choice do you have when you try to get in touch with a company , and
get the run-around? I would LOVE to PURCHASE sundog today, but can't find anyone to sell me the full
game. Can you blame someone for pirating one?? Hmmm. Sorry for the digression.

Anyways, anyone have one I could BUY? <g>

What do you mean? Using a PC formatted SCSI hard disk connected to an
ST, and then try to read the data from this harddisk (i.e. for text
files etc), or...

Connecting an IDE type (PC) harddisk to the ST?

I'm pretty sure that ther is only one RSVE, but there are 2 hardware mods. One of them is the 38000 or Fixed Rate mod which just locks your port at 38000 and the RSVE thingy which is just your good ol' whatever speed you want type arrangement, don't worry about being wrong, i think I was wrong once ;-)

I have been an Atari user since 1982 and I have seen the same thing that most of us Atari users see all the time. The company had a good idea and then never supported it. Atari doesn't support anything much anymore. I don't know much about the Jaguar so I won't comment on that. All we do is gripe gripe and even more gripe. Why don't we do something about it, the stock on the American Stock Exchange is approx. $4-$7 a share (I haven't looked in quite sometime), why don't we just buy the company and then they will listen to us. Then if we have more than 50% of the voting stock, then we can do things. I know this is NOT a practical notion, but it may stop us from griping all the time about Atari's lack of support. I am guilty of this too, wish I could afford a few million shares of the company. What do you all think?

Hi there!

Well, I know something more about the Hades and the Medusa!!
These are surtanly the best computers I've ever seen!
Not only the really fast cpu but everyting! The Hades is
a little better, he has standard a Scsi2 port and even
enhanced-IDE, both computers up to 4GB yes GB of RAM (not
directly on board, but it is possible!) The Hades has a
fully PCI structure so any PCI card (when you find the drivers
can be used). It is very good for graphics cards, SCSI hard-disks,
or whatever...
Unfortunately, Motorola doesn't produce the 68060 yet at full speed,
because they are a little to busy wricht now, but the Medusa T60 is
ready, waiting on his harttransplant... then it will be almost
the fastest desktop computer in the whole world!
It is also a pitty that MagiC! does't run yet on the Medusa nore the
Hades! (it has something to do with the VDI routines) but it will come
as soon as Behne & Behne have more time and the Medusa and Hades have
been sold enough..

All I can say know is that Fredy Aschwanden is a real genius! I spoke
with him and the crue of M&W electronics and Atari still has a future,
only when you all buy these very good computers!!! I know they are
expensive ($4700 for the Medusa T40 and $2500 for the Hades), but if they
don't sell, the prices won't slash!

Just hail the fuji again and do as I do, buy Atari stuff and let the
world know Atari still exists!

Any question can still be asked, I have good contact with M&W electronics
GmbH, and they are the best!

Greetings, Jan Dooms.<jandooms@tornado.be>

>perform better on computations. A 16Mhz 68030 is, in my experience, equal
>to an 18-to-20 Mhz 68020.

But isn't it also true that the Falcon's '030 sits on a 16-bit bus
(stupid, stupid, stupid) while the A1200's '020 sits on a 32-bit bus
on the motherboard?

Maybe I'm wrong here, or just being pessimistic? :)

In any case, internally, operations would be faster for the Falcon's
'030 but when communicating with RAM it would be slower (which would
be a great deal of the time).

Again, please let me know if I'm wrong....

Be careful also with the screws that hold the front of the machine together,
they're shorter than the ones at the back!

Well, I've also heard that the media is different, and that you should never use a HD disk as a DD disk (i.e. never format a HD disk as 720K) because the magnetic coating needs a higher current to magnetize it or something along those lines.
Why make this so complicated? Use HD disks for 1.44MB and DD disks for 720K! They're obviously made for their respective densities, so stick to it and you're safe (well, most of the time that is!).

A good thing is that Atari drives aren't "stupid" like some PC drives are (or rather set up to be), so you won't be able to format DD on an Atari with a HD disk inside the drive (obviously with a HD disk drive installed).

If you have access to a Unix command line shell you can type:

gzip -d examplefile.Z

If the file is in addition tar'ed you can combine the whole process
with:

tar -zxvf examplefile.abc.tar.Z

Good luck!

Hi Phil,

PD>We now have Mint, Linux, and NetBSD that I know of and none of them do
PD>colour.

Linux/68k do colour, but normally slow! The problems are the graphicdrivers, until now only a simple, generic graphicdriver exist for Linux/68k on Ataris.

Linux/68k supports the following graphiccards: ET4000 (e.g. in the Gengtec card, Mega4000, Medusa, VOFA), the Nova Falcon, Nova VMEplus, Supernova and of cource the ATI Mach64 here in my Medusa, so i work only in 256 colours. This list isn't ready, in principle nearly every graphiccard is supported by Linux/68k!

Small caveat to the format-a-PC-disk-on-the-Mac solution.
If the 520ST is running single-sided (360K) disks, then of course the
disk must be formatted as a single-sided one. I'm not sure this is
possible with e.g. PC-exchange on a Mac, which may only handle the
double-sided (720K) format...
Single-sided format should be possible from DOS on most PC's.

No, that's not correct as I tried this with my TOS 1.6 (STE TOS) and
my new TOS 2.06, and the disks formatted from the desktop weren't
readable on a PC, but by using an MSDOS compatible formatter it worked
just fine! (I used "Hcopy 1.6" which I believe you Claus has
participated in designing!- Is it still supported?)

2837. New Atari owner needs guidence. :)

Newsgroup: comp.sys.atari.st
Date: 1995-11-30 00:00:00 UTC
From: icd@mame.mu.OZ.AU
Message-ID: <icd.817702886@dynamo.mame.mu.OZ.AU>
Source record: 155495

On a whim, when I saw an Atari 1040STFM available for $250, I decided to buy it. Bear with me, I've never owned an Atari before. :)

What I got: One Atari 1040STFM with colour monitor (1224 or something), mouse, joystick, lots of coverdisks and a legit copy of a sequencing program called C-lab Creator (or something like that). I have some questions.

1) Whats an STFM? I can find no reference to this (I assume) submodel anywhere. Only STe, MegaSTs, and so on. I assume its some derivative of your standard ST.

2) Is C-lab Creator a good program? Can I actually do decent sequencing with it?

3) I note that the machine has a hard drive port. Are hard drives still available, new or second hand? What sizes and speeds? Can you butcher (cheap) IBM equipment to the job? I'm in Melbourne, Australia.

4) I see mention of various ROM versions, 1.0, 1.4, 2.X. Are upgrades a necessity, and if so, how?

5) What should I do with the beast now? :)

Thanks for any help you can offer,

Ian

PS Ironic, I started my computing days on Z-80 machine running CP/M by DRI. Then I moved onto IBMs, where I had a preference for DR DOS, by DRI. I buy an Atari, I click on Desktop Info, and I find its running GEM, by DRI. :)

2840. BAD MOOD progress report

Newsgroup: comp.sys.atari.st
Date: 1995-11-30 00:00:00 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <49kag5$lr5@nyheter.chalmers.se>
Source record: 155498

I just realized that everyone who might be interested in BAD MOOD
probably does not read c.s.a.programmer, so...

The BAD MOOD internet project to create a FreeWare Falcon030 DOOM(TM)
WAD compatible game has recently taken a huge leap forward.
This is mostly thanks to the work by Douglas Little (of APEX media).

Version 1.32alpha of BAD MOOD is now available via WWW/ftp (see .sig).

So what's new?

- No more C code!
The full '030 assembly code is included.
- Runs in Falcon true colour mode.
Both RGB and VGA are of course supported.
- More than two times speed increase.
In _many_ places it's _far_ more.
- The display can be resized.
At 160x100 the frame rate is usually _very_ nice.
- All display glitches have been removed.
- A 2D map can be overlaid.
- Mouse control added.
- Some lighting effects.

...and more.
There's also a first DSP aware executable in the distribution archive,
which if course improves the frame rate... ;-)

For those of you without Falcon's, the C version of DVIEW has also been
updated. Versions are available compiled for the old 68000 Atari's as
well as for '020+ machines. These versions run in 16 or 256 colour bit
plane modes. Full C sources are included.

By the way, it has been discovered that BAD MOOD (and DVIEW) actually
loads DOOM 2 and Heretic WADs as well as the original DOOM ones.
A tip: third party WADs work fine and are usually a _lot_ smaller than
the commercial/ShareWare ones.

I agree. If I were rich, that's what I'd do. Since Bill Gates IS
rich, that's what he might do. Since I'm poor, I use Ataris because I get
a lot of computing for my dollar.
We live in the illusion of democracy. We should remember, that the
only vote we have which counts, is the dollar! (or pound, or deutchmark,
etc...) Buy what you love, 'cause what else is money good for?

There *does* seem to be something strange around this problem...

Yes, because my girlfriend couldn't read the 720 kB DOS floppy
I formatted for her with E-Copy on my Falcon, at our university
(Dell, ICL, etc. computers). The floppy was perfect; I checked
it many times. And E-Copy is one of the few programs that makes
disks readable even on Macs (those devils are VERY picky...).

So, I can only draw a conclusion that since "nobody uses DD disks
in PC world any longer", some PCs today are somehow set up not to
recognize them at all. I can't understand why, but this really
seems to be the situasion.

But then, PC-community has happily forgotten its ideas of
"compatibility". New stuff, both hard- and software, seldom
works on older PCs. People act like they're crazy; all GO
and buy a new PENTIUM MULTIMEDIA PC, and WINDOWS 95, that's
when the big life really begins! Forget your old suff, use only
NEW MULTIMEDIA-STUFF, UPDATE your good old programs - and see
how they run on your PENTIUM slower than ever (at least, if
they have the word "Microsoft" written in somewhere..).

Be a member of The New Power Computer Generation, but don't
start thinking too hard... Brain and Microsoft/Intel apparently
don't fit under the same roof.

So: after this crazy circus going on around us, how could we
be surprised to see DD-floppies no longer supported..? ;-(

I have had the same thing on occasion. I don't know if this is your problem
since the archivers usually complain, but make sure you type 'binary'
before starting your ftp 'get' if you are transferring archive or executable
files. A lot of ftp sites enable this autonmatically but a lot don't and if
they haven't it will give you a hard time when trying to unarchive or run.

Hope this helps...

ENGLISH.SYN does not exit for this program but there is a dictionnary for the english language.

2853. Gemulator 95 ver. 4.1 now shipping

Newsgroup: comp.sys.atari.st
Date: 1995-12-01 00:00:00 UTC
From: brasoft@coho.halcyon.com
Message-ID: <49ne3a$4or@news1.halcyon.com>
Source record: 155311

Today we are shipping version 4.1 of Gemulator 95, the Atari STE emulator for Windows. This new version will be on sale this weekend at the Toad Atarifest in Washington D.C. at a special show price of $199.95. Call Toad Computers this weekend to place your order. This price includes the Gemulator 4.1 emulation software, the plug-in card for your PC, and a set of TOS 2.06 ROMs pre-installed on the card.

Gemulator 4.1 now supports Windows NT and is optimized for both Windows 95 and Windows NT. This new version has faster video (especially in the high resolution 1024x768 and 1280x1024 modes), smoother mouse movement, improved compatibility with very large disk partitions, and faster booting to name a few features.

To find out more about Gemulator 95 browse the Gemulator web page at

http://www.halcyon.com/brasoft/

The Gemulator 4.1 upgrade is free to all registered users of Gemulator 4.0 or higher and can be downloaded from the private Gemulator download area on our web page. You must have your registered user password.

>jason

OK, let's clear some things up:

1) There are indeed distributors for Zero-X in the UK, in fact even two: Digital Village and System Solutions, so if you are interested in the program, please turn to them. I know they have resellers in all over the country. In fact we have distributors for Zero-X in almost every european country + US.

2) I don't have any distributor of EPSS, buts many people have payed the shareware-fee and got their registered versions of the program together with a lot of songs and patches. The current version of the program is v1.01 and it works for STe/MSte/TT and Falcon. It is a little bit enhanced for Falcon concerning the look, but no special 16-bit sound or usage of the DSP yet (see below).

3) You ask how you pay money to the Potal Giro Account. It works exactly like transferring money to a bank account, with the name of the bank beeing 'Postigirot Utland, Sweden', the account number beeing 4284870-5 and the company name 'Copson DATA'. All of our Zero-X distributors pays this way from all over the world and it works perfectly.
The currency mentioned in the info-box of EPSS is SEK, which means Swedish Kronor, which in fact is the currency used in Sweden. Not so

hard to guess I think... :-). Anyone who wants to register, please skip the post and package... Special Christmas offer :-)

4) Concerning further development of the EPSS: I am currently fully occupied writing Zero-X together with Peter Segerdahl of Vinga System, and I simply don't have the time to work with both programs. Zero-X is aimed at the professional and semi-professional market which also makes it more rewarding to spend my programming on Zero-X rather than EPSS, but perhaps in the future I will continue with EPSS and make it like a complementing program for Zero-X...

5) DSP-drivers for EPSS is currently in work by a Hawaiian EPSS-enthusiast named John Perez. I don't know the current status, but the last thing I heard from him was that he just had started coding the DSP-routines, so we will se what happens.

: : Theres a good shareware one called ZORG (about V2+) available at
: : Hensa. You have to register to get the defrag options (v1.96 DOESN'T
: : REQUIRE REGISTERING TO USE DEFRAG).

The shareware version of BlitzSchell is quite speedy. However it will not check your disks for errors before defragging. I always use Cleanup ST first then I run my registered version.

Don't have much of a frag problem since I switched to TOS 1.04. A 540 meg drive helped too!

>is a AW disclaimer ?, the situation is not looking good IMHO :(

Fair enough, but that said I prefer to buy my magazines in the shops.
Today I went in to WH Smith's and there were quite a few on the
shelves. Normally this is not the case - in fact I thought AW had gone
under for about 4 months because every time I went in I saw none.
Obviously this was bad timing on my part but does it not also imply
that if more issues were placed in shops, then they would be sold?

(btw this is Nottingham in case anyone finds it relevant)

I have the shareware version of Pacman on E's (I call it Pacman from here) which is very awesome. Gordon from Sinister Developments had sent me the SD games which he said were now PD :) He also said the Pacman game was also made PD by the guy who wrote it. He tried to send it to me but it got mucked up in the Unix account-to-floppy disk transfer. Anyone know which site I can get this from or maybe some kind soul can e-mail me a copy? I think it might be under the name Pacman On E's 2 which I saw in ST Format a few months ago. Thanx for anyone's help.

I think that after being forced out at CBM, the Tramiel's have
learned to keep 50+% of the stock in their own hands! That's one of the
reasons Atari Computers could never compete with anyone. They would not
dilute their holding by issuing new stock to expand the business.
Therefore they were always a small company with limited production
facilities and will stay that way! Rather be a big frog in a small pond
than a dry frog!

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:
> What is the relative performance of these two machines?

Relatively speaking, one is faster than the other. {[:-)]

Seriously, though, the Falcon is a 16Mhz 68030 and the A1200 is a 14 Mhz 68020.

(I can recall some Meagre owners bemoaning the 68020 when the 1200 was launched, because of it's inferiority to the '030 that the Falcon had)

Computation wise, the '030 will beat the '020 at the same clock speed (but not by much, in my experience). If the algorithm that the program uses is "68030 cache aware", then the gap widens a bit more.

So, all else being equal, the Falcon has the faster processor, so it would perform better on computations. A 16Mhz 68030 is, in my experience, equal to an 18-to-20 Mhz 68020.

The memory and other hardware subsystems will play a part in the performance as well.

Lots of people have done the 38400 mod to a ST.

>I've heard that with 38400bps one can expect to lose a character every second
>at 38400bps
Not so. Use the HSMODEM AUTO programs and set MFP.PRG to FASTINTS.

>Which one is the most expensive, reliable, easiest,...?
The 38400bps mod I detailed in ST Application Issue 41 and in a recent Atari
World magazine Issue 6 costs about 5 UKP and takes about half an hour to do.
It is easy if you are competent with a soldering iron.

>again, Quadra never feels very fast to me - unless perhaps when doing
>some CPU-intensive task, like packing.

Having both an Atari and a 68040 Mac, I can confidently say that the 68040 Mac IS fast. Microsoft Word is a TERRIBLE example because Microsoft, in its latest generation of software, has DELIBERATELY made the Mac software slower than the PC in order to sway people toward Intel hardware (in my opinion).

Try running Netscape, PageMaker, FrameMaker, Synamtec C++, Think PASCAL, SoundEdit 16, Marathon I & II, etc. and you'll see pretty quick computer in the 040 Mac.

Don't get me wrong; Ataris are cool, but Macs are the next best thing.

These sort of things are easily generated with POV (available for Atari,
Mac, PC, Unix, etc, and it's free).

I have a Fuji POV object on my machine at home (originally constructed
by Warwick Allison). If you want this, Email me a reminder to
hoagy@cix.compulink.co.uk and I'll forward it on.

1.) Yes, the "ICD" Host Adaptor software will NOT work without
detecting a ICD Host Adaptor. For $50 you can buy the ICD 'Pro' software
and it will.
2.) Atari Software: Did you Disable Parity on the Hard Drive? If
so it sounds like the terminators are missing from the Hard Drive. I just
fought with a Seagate ST157N and a Supra Controler with a seperate
Terminator. Got the same resposes you are speaking of until I figured out
that the Supra Adaptor was not supplying Termination power on the SCSI
Bus. Once I modified the Adaptor it worked fine. In your case you just
have to find the correct terminator R-Packs and plug them in if they are
missing.

>
>any suggestions would be greatly appreciated.

Assuming you are getting to the end of your dial.txt and finding that if
you do an ifconfig it returns an ip address of 0.0.0.0 for your machine:

Try making the following changes to your startup.nos file:
1. comment out:
ip addr [0.0.0.0]
2. As your first ppp parameter line add:
ppp sl0 ipcp local address 0.0.0.0

Add the following line to the end of your dial.txt file:
status up

I had to make these changes when my internet provider switched from
an analogue to a digital phone system and switched of an Annex server to
something else.

I suggest you get rid of warp 9, it does strange things to modems on my
machine. (Falcon030 with TOS 4.04). I'm using HSMODEM6 as my only
serial patch and no CPX.

I think Jï¿½rgen Stessun supplied the floppy routines, which were IMHO
based on code from Claus.
The shareware version of HCOPY 1.7 is still around, but the author does
not take registrations anymore - you can either use the limited version
(and pay for that), or buy the commercial E-Copy, the successor of H-Copy.

2885. Pagestream e-mail group

Newsgroup: comp.sys.atari.st
Date: 1995-12-01 00:00:00 UTC
From: hellman@teleport.com
Message-ID: <49luf7$fcg@maureen.teleport.com>
Source record: 155343

Hello All,
In a previous post I asked whether there was an existing
Pagestream mailing list, or if someone could set one up.
People are interested in getting something going, but I don't see
anyone being able to run a list right now.
What I'll do, then, is to start an e-mail group. If you're
interested, let me know by e-mail. I will construct an address header
with up to 30 people on it. We'll all agree to reply to all when
posting. This way everyone will see everything, like a mini mailing list.
The general idea is to exchange information, tips and questions
about Pagestream use. All levels of users would be welcome.
So send me mail if you're interested. If you already replied, as
some did previously, expressing interest, there is no need to do so
again. I saved your messages.

In response to article <49g1su$iph@josie.abo.fi>, thietavu@news.abo.fi
...

The ColorSmart Technology of Hewlett Packard's is built in to the firmware inside the printer's hardware. This firmware is what uses the PCL commands to generate the ouptut. This is why the 600 series is so much like the 500 series, and why the Calamus 550C driver works so well on a 660C. In addittion, the documentation indicates that the ink used for the black and tricolor cartridges are not the same consistency as those used in the 500 series (500C, 550C, 560C). In the 600 series, the cartridges (and ink) were redesigned for the goal of 600 dpi printing. At this time, though, the color graphics for this series printer is still restricted to 300 dpi. Don't ask me why, I am not an HP engineer.

ae> even know that it exist. : ;-(
ae>
ae> So, start an EPSS commercial campain. Some nice info-postings on
ae> usenet/fidonet/nest would almost certainly gain some effect.

I tried that some time ago. I even wrote a long letter in this group about it,
but no one ever said a word. :-(

ae> : Sounds interesting, but there is no DSP UCDM players for the falcon or
ae> is : there? I mentioned Tords name because I know that he were working on
ae> a player : for the DSP. If he have done it and it's a UCDM player and
ae> EPSS supports it we : can start talking business. :-)))
ae>
ae> If I don't remember totally wrong, Tord has written a DSP UMP for
ae> Obsession Falcon (now scrapped), but it was not 100% UMP compatible (ie,
ae> the Octalyser UMP format). And as far as I know, EPSS has no UCDM slot
ae> yet.

What have happened with Tord? I havn't heard a pip from him for a long time
now. I think this EPSS realy could become something as a DSP version would be
very nice. It would not need to slow down the system at all as the current
version does. :-)
ae> : I would also think tha C-lab would be very interested in selling this
ae> program : with the falcon. It would be a perfect "musicpack". :-)
ae>
ae> Go ahead, contact C-Lab, I'm sure they are interested to increase the
ae> sales of the Falcon, and licencing a sw program is done with little
ae> effort and cost.

Why should I do it? If someone should do it it should be Copson Data.
All they have to do is to send a copy of the currenst version to C-Lab and tell
them if they are interested they could do a falcon DSP version and I think they
will be when they sees it... :-)

mvh,
Magnus Kollberg

2893. Hard Drive Cautionary Tale

Newsgroup: comp.sys.atari.st
Date: 1995-12-01 00:00:00 UTC
From: andrew@ajrose.demon.co.uk
Message-ID: <817832862_OASIS_@ajrose.demon.co.uk>
Source record: 155351

Before I begin: RIP my old drive...

After the sad demise of the Seagate drive in my Protar Profile II, I decided the time had come to upgrade to soemthing a bit bigger than the 40 meg drive I'd been using.

After a few calls to Gasteiner in London, I bought a 540 meg bare SCSI drive to fit into my Profile case, thus negating the need to spend extra cash on cases, power supplies, ACSI to SCSI converters etc - as this is all inside the Profile box.

The drive arrived, it opened up the case, plugged it in, and....nothing! Zilch! No drive there, apparently. It fired up OK, and I heard it do it's bit (whatever drives do when you turn them on), but I couldn't get the computer to recognise it.

Fortunately I live 2 mins drive from Systems Solutions in London, so I popped down with the drive on the off chance I could find someone there who'd lend a hand, or sell me some device to make the drive work...

Luckily for me, there was a lonesome engineer there who fancied a bit of a challenge. Turns out the drive controller likes to see parity bits set to OFF, the sort of thing you can do using jumpers on some drives, but not on this one (nobody at Gasteiner had asked me this). Two solutions: 1) spend 90 quid on an ICD link and unplug the drive conroller on the Protar, losing the drive busy led in the process :-(
or
2) Find a frienmdly, knowledgeable chap with A DIFFERENT SCSI COMPUTER (such as a Falcon) to reprogram the low level internal hard drive software - you know, the kind of thing you do every day to a device you don't even get a manual for - Labour charge one hour (40 quid) and it's all set up, partitioned, with boot-up software installed and tested.

I opted for #2, and found when I got home that not only was the new BIG drive working brilliantly - quiet, much much faster, etc, but that the Protar allowed me to sit the old drive next to the new one, run both together, and salvage about 15 megs including my entire C drive direct to the new drive - MagiC and Ease recognised both drives and renamed partitions on the old drive AND placed them onto the desktop for me - the many hours of anticipated compressing old files onto 720k floppies were reduced to a few seconds of drag and drop on hard drives. (How to impress a PC owner newly acquainted with the idea of "Plug And Play" - ask them if their box would do this)

The moral: if you've got an older controller, like that found inside the Profile, ask about parity. But go for it - they're so cheap now it's foolish not to upgrade from the 20 or 40 megs that were standard a few years ago.

And big thanx to Systems Solutions :-)

And no thanx to Gasteiner ("Our technical guy is at a fair until next week.... no he doesn't have a mobile number.... sorry... call back tomorrow at 2pm maybe.... etc etc") who were told what the drive was for before purchase and didn't enclose any documentation... :-(

The other moral: Don't try cutting too many corners.

Andrew

: What!?!? Is Atari World dying ??

Reading the NEST.ECHO for ATARI WORLD, The general opinion is that
unless they recieve more actual subscriptions then there is no future for
the mag, Joe Conner who writes the pd reviews states that this is very
important or the mag wont survive, so its not just tittle tattle if the
actual writers of the magazine are spreading such stories, even if there
is a AW disclaimer ?, the situation is not looking good IMHO :(

Cheers.............!ynoT

2897. Help with Atari 1040St and Canon Printer

Newsgroup: comp.sys.atari.st
Date: 1995-12-01 00:00:00 UTC
From: GSammons@gnn.com
Message-ID: <49nsub$qr1@news-e1a.megaweb.com>
Source record: 155355

Howdy,

I'm trying to find out if it is possible to get the Canon BJC 4100 to print in color using an Atari 1040St. The printer will print text and pictures in black and white, but I have yet to find a way of printing in color. Does anyone have any suggestions? Thanks for any help you can provide.

2898. printer driver in Word Plus 4

Newsgroup: comp.sys.atari.st
Date: 1995-12-01 00:00:00 UTC
From: dobra@monet.fh-friedberg.de
Message-ID: <1995Dec1.080656.9174@news.fh-friedberg.de>
Source record: 155356

Hello, everybody,
a friend of mine bougth a HP Deskjet 510 to print his writings with
Word Plus 4 and 1st Word Plus.
On a disk we found a lot of drivers, were able to install the *.CFG-drivers
for 1st Word Plus and we can print now with this program with CG Times 12pt
and Lett Goth 12pt. Really good.
And we found drivers *.PRT which might belong to Word Plus 4, and we
installed them, too. But our problem now is how to say this silly program
to use them !
In the printing menue it only shows the earlier installed printer, the Epson,
but there is no chance to install one of the others!
And the manual only tells that there are a lot of drivers for this program
but not how to change them !
So - has anybody a good idea for me to change the printer type in Word Plus 4
to help my old fellow (he is 70) to go on working with his atari ?
Any commands could be helpful.
Into this newsgroup or PM.
Doris Seitz

From: aw@zaphot.augusta.de
Message-ID: <FLBQBFDZUP@zaphot.augusta.de>
Source record: 155358

In <macdonald.235.000F3574@cfcsc.dnd.ca> Ken Macdonald wrote:

>Does anyone have any experience with installing either, or both, of these
>serial fixes for the ST?
>I've heard that with 38400bps one can expect to lose a character every second
>at 38400bps, and that one needs to program a chip for the rsve. Which one is
>the most expensive, reliable, easiest,...?

==========
PART I - RSVE
==========
RSVE2 (the newer version of RSVE) is a very simple hardware modification:

A little GAL (grid array logic - a logic chip, which can be burned like
a EPROM) "catches" the frequencies for 75, 110 and 150 bps and "translates"
them using a second oscillator so the MFP will run with 38400, 57600
and 115k bps.

Some people told something about a PIC ... NOPE! There is no PIC, no
micro controller etc.! Only a simple grid array logic chip, which does
not need any software to work!

The result:

75 bps are now really 38.400 bps
110 bps are now really 57.600 bps
150 bps are now really 115k bps

RSVE2 consists of 1) the GAL, 2) the oscillator, 3) four wires to the
MFP 68901 to scan the incoming clock frequencies and to produce the
new clock frequency for the MFP.

No software is needed to USE these new bps settings! (When using
MagiC (or Mag!X) operating system you really can use these additional
speeds without any problem!) But there are some ugly bugs in Atari-TOS ...

==========
PART II - HSMODEM
==========

The problem: The original I/O-routines of Atari-TOS are buggy and
too slow to handle high speed above 19.200 bps:

1. RTS/CTS-handshake does not work (not a problem of RSVE - this is
a BUG of TOS(!!!))

2. I/O is too slow to get more than approx. ~1200 cps on a slow 8MHz ST

HSMODEM provides the following:

1. It will replace the buggy and slow BIOS-I/O with fast and reliable
code which allows you to use RTS/CTS-handshake AND get high cps-rates.

2. It will (optional) add a cookie "RSVE", so newer software (e.g. CoNnect)
will determine the existance of RSVE2-hardware and allows you to
choose 38400, 57600 and 115k instead of 75, 110 and 150 bps.

I use HSMODEM (revision 7) with RSVE2 in my old 1040STe (8MHz) and i
can go up to 38.400 bps with plain TOS or up to 57.600 bps (!!) with the
MagiC multitasking operating system.

1) Don't forget to use "RTS/CTS" handshake!
2) Use the right software ;-) (e.g. CoNnect for comm. or UPoint for UUCP)

Ciao... Arno

Actually, the 500 series DJs are supported now. And I see (every so
often) new additions to the list. Whether this will continue - uhh,
sure hope so. You could ask STraight Edge software - they do
OutBurst and JetSpeed to make the printouts faster, and may have
some impetus to write new drivers now that Soft-Logik doesn't.

G > you can provide. Geoff gsammons@gnn.com

AFAIK your best bet is ImageCopy, which is up to v4 (I think). The v3 manual does not list the 4100, but if it is similar (with similar emulations) to the BJ130 or other BJs, Jeremy Hughes (the author) may have some advice for you. Contact the FAST Club in Britain to see what they have to say. Toad sells it, and may know the answer, too.

For color text *and* graphics you may have to get Calamus SL. I suspect that any printer known to man will eventually get into their printer driver files. PageSTream users (like me) also have hopes that printer drivers will continue to fall like manna from heaven.

Hope this helps.

: console..

I doubt Atari will axe the Jag in the short term, it is the ONLY substantial
;-) business that they have. Basically if they stick with it then they have
a chance of recovering some if not all of the costs. Basically the profits
come from selling the games, NOT the consoles, these sales should improve
substantially after Christmas.

I am running X on My linux system in 16 and 256 Colour modes without any trouble ?
Don't know about MiNT (I think that is ATM mono only) but would imagine that netBSD
has colour support , it does support Falcon screen modes fine.

>Funny, I've been using HSModem with STalker with several different modems, on
>everything from an ST to an STE to a Falcon for years. I wish I'd have known
>they were incompatible. :^)

Let me be more specific about my setup, then... I use a Falcon w/ TOS 4.04
and STalker v3.05. If I use HSModem, the RTS/CTS handling fails, reli-
giously. Using the FPATCH program, as recommended by the authors, works
properly. I've found this to be consistently true with my Supra 14.4 and
my Intel 14.4 modems, both of which I use with my Falcon set and locked at
38.4

I have tried this on 3 different Falcons, the other two being TOS 4.02,
and my results were the same: HSModem does not work properly with STalker.
ZModem downloads consistently fail from garbage and checksum errors.

Your mileage may vary, apparently.

>Oh, _now_ someone tells me! :) Hopefully this will fix the problems
>then... :)

I am reading messages that say my statement above is not true... In my
experience, STalker consistently fails to properly handle RTS/CTS flow
control when HSModem is installed. Your mileage may vary, so experimentation
is the answer.

I'd appreciate hearing what you learn.

>it with STalker.

It's interesting that you say this, Dan... Weren't you at the show in Toronto about a year ago? I believe it was you I spoke with back then about this same problem, to which you said the same thing: "This is the first time I've heard...."

I came home from the show wondering how I'm going to resolve this problem, I posted a message here in comp.sys.atari.st, and I got a reply back from some one -- a saint, to be sure -- to stop using HSModem with STalker, and haven't had a problem since.

I'll repeat my setup: I have a Falcon with TOS 4.04 and STalker v3.05. The problem has been consistent with STalker v3.02, 3.04, and now 3.05. I've tried it on 2 other machines besides my own, one of which has TOS 4.02, and the failure to handle RTS/CTS has been consistent on all 3 machines.

Maybe I jumped the gun by stating that HSModem and STalker are incompatible, however the two simply DO NOT WORK on the three machines I've tried.

Dan, I hope you can experiment with this and shed some light. It's kinda frustrating. (You did mention to try setting to 7 bits, 0 parity. I'll hafta give that a try. Seems an odd thing to do to an 8-bit connection, but if it works I sure won't complain!)

Thanx for your input!

Phil,

I know that Danny was posting it at Hensa so you can try there. You can also get it on Atari's Web page, as well as STReport's page. If all else fails, you can subscribe to our mailing list and we'll send it to you uuencoded regularly each week.

Thats 'cause ASCII stuff is the easiest to transfer, because it needs
no translation. You talk about bitmaps and gifs (nb. gif _IS_ a
bitmap). This really depends on what you want to do with them. There
are many easy ways to do conversions, or even avoid the conversion
altogether. If you have specific details (Ie. the progams you plan to
use, the uses, the type of bitmap etc. etc. etc.) then mail me
dircect and I'll sort you out, I've been soing it for ages and it'll
be quite painless (I hope <G>).

That should read "a CPU with MMU and an FPU". Hence, a 68030 or better,
and either an '81 or '82. Linux works fine on my TT, and I had NetBSD
working for some time on my Falcon. (added an '82)

thietavu@news.abo.fi (Tommi Hietavuo TKKK) spake thusly:

TH> my girlfriend couldn't read the 720 kB DOS floppy I formatted
TH> for her with E-Copy on my Falcon, at our university (Dell,
TH> ICL, etc. computers). The floppy was perfect; I checked it
TH> many times. And E-Copy is one of the few programs that makes
TH> disks readable even on Macs (those devils are VERY picky...).
TH> So, I can only draw a conclusion that since "nobody uses DD
TH> disks in PC world any longer", some PCs today are somehow set
TH> up not to recognize them at all. I can't understand why, but
TH> this really seems to be the situasion.

Well, if that doesn't beat all!
I have been advising people to buy preformatted DD disks for this
situation. Looks like good advice - if they can find them in stores.
I always spurned them before, because formatting a floppy is no
problem on the ST, and it gave me a nice warm glow that an idiot
like me could format a floppy, and the pc users hereabouts were
badly frightened by the prospect.

Off on another tangent - has anybody seen the IBM Aptiva ads lately?
Big Blue is advertising that *their* multimedia machine has a "new
technology" - a chip that plays the music without using up a lot of
CPU horsepower. Can any of the Amiga people reading this group sing
us a couple of bars of "Hey, Paula"?

Yes the FM means that it can be plugged into the aerial socket of a
TV(Frequency Modulated?). It is a slightly older model than the STE
and is probably equipped with TOS 1.02.
>
>2) Is C-lab Creator a good program? Can I actually do decent sequencing

I imagine so. I believe that there are shareware progs around that are
good and so this should be good. The MIDI ports are built in of
course. All you need to do is connect them to a MIDI instrument.
>
>3) I note that the machine has a hard drive port. Are hard drives still
>available, new or second hand? What sizes and speeds? Can you butcher
>(cheap) IBM equipment to the job? I'm in Melbourne, Australia.

If it is TOS 1.02 then you will need a couple of progs to sort out
some bugs. I used to use Folderfix and anothe one I have forgotten!
The system is a sort of SCSI so I imagine that you are talikng about
IDE hard drives. As far as I know these will not work. BTW the Atari
will read 720K IBM formatted discs.

It is a good little computer and if you can get a hard drive and
upgrade the memory (might be problem, except from Atari suppliers as
you have the STFM) then you can do an awful lot. I would definitely
try using the sequencer and you can even get on the Internet with the
right progs. Shareware all of them.

Enjoy it.

I would suggest that you just get STZIP I think it is on about version
3 ATM. That will deal with all your zip files. How big is this
Starter.tos? It may be to big for a disk when unarchived?

s> very important or the mag wont survive, so its not just tittle tattle if
s> the actual writers of the magazine are spreading such stories, even if
s> there is a AW disclaimer?, the situation is not looking good IMHO :(

As the moderator of that area I think I ought to say something...

In some areas the sales are low enough for the main distributors to drop it in favour of something else. This happens all the time (I've been hard-pushed to get a copy of STF over the last couple of months for the same reason). If people spend all their time traipsing around to find it and complaining it's not to be found it gets a bit pointless when it can still be reserved at your newsagent or you can buy just a 3-month sub for less than a tenner.

If people fail to get the mag as a result of the decision of a distributor then you'll lose out as well as the mag. This is damaging and will eventually affect the life of the magazine. This is just as true for any Atari mag these days. As everyone's said, STF is getting thinner and ST Apps has turned into a disk mag, so the consequences are clear. It's only a year or so ago that ST Review and ST User closed down altogether.

So, if you like a magazine and would prefer that it continued, whichever one it is, go out of your way to buy it otherwise eventually it won't be there to buy.

In answer to Henrik's question, the whole Atari market is contracting...

2941. Looking for Chris Karchnak (Buckaroo Banzai)

Newsgroup: comp.sys.atari.st
Date: 1995-12-02 00:00:00 UTC
From: ifilk@mindspring.com
Message-ID: <ifilk-0212952105040001@ifilk.mindspring.com>
Source record: 155387
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Hi,

Does anyone here have contact information (ideally physical address or E-mail address) for Chris Karchnak (who used the pseudonym "Buckaroo Banzai")?

He's a very neat person used to be very, very active in the Washington DC area Atari community in the 80's/early 90's, and I lost contact with him around the time I went to college, and I'd love to get in touch with him again to see what he's been up to.

THANKS!

Not unless they can sell a lot of consoles to fuel the sales of titles.
Something Atari has failed to do so.

CLOSET CLEAN OUT SALE

Make me an offer via E-mail on any or all of the items below. All hardware is in working condition. You should include shipping costs in your offer. If your offer is chosen I will ship after your check or money order clears the bank.

ATARI 800 COMPUTER
comes with TV cable, power supply, owners guide, peripheral cable, 48k RAM, 10k ROM, ATARI 800 Basic Reference Manual. Books included, (1)Your ATARI Computer, a Guide to ATARI 400/800 Personal Computers, (2) Mapping the ATARI, (3) ATARI Basic. Cartridges included (1) Basic Computing Language, (2) Centipedes with instruction book, (3) Asteroids with instruction book, (4) Congo Bongo with instruction book.

ATARI 130XE COMPUTER
comes with TV cable, power supply, owners manual, peripheral cable

ATARI 850 INTERFACE
comes with power supply, interface operators manual, printer cable

SIGNALMAN MARK III MODEM
comes with power supply, cable, instructions, Telelink I cartridge with instructions.

ATARI 1050 DISK DRIVES 2 for Sale
Each drive comes with a peripheral cable, power supply, owners guide, DOS 3 with reference manuals. DOS 2.0, 2.0s, 2.5, 2.6f, 4.0, no manuals for these. A variety of software on disk, utilities, database, games and one box of new blank disks.

ATARI 410 PROGRAM RECORDERS 2 for Sale
one has an owners manual, both have a blank tape

SOFTWARE
(1) Synfile + (plus) a database for ATARI 800/130XE computers with user manual
(2) Syncalc a spreadsheet for ATARI 800/130XE computers with user manual
(3) Print Shop and Print Shop graphics library, both have manuals
(4) ATARI Writer Plus word processor with manual

BOOKS
(1) Games for the ATARI
(2) 6502 Applications
(3) Computes First Book of ATARI
(4) Computes Second Book of ATARI

Thanks in Advance

: >some CPU-intensive task, like packing.
:
: Having both an Atari and a 68040 Mac, I can confidently say that the 68040
: Mac IS fast. Microsoft Word is a TERRIBLE example because Microsoft, in its
: latest generation of software, has DELIBERATELY made the Mac software slower
: than the PC in order to sway people toward Intel hardware (in my opinion).

Yes, you're right - I used wrong words. 68040 Mac _IS_ fast - but many of
its programs just aren't. And I think you may be right: Microsoft may want
to kill the "other" systems...

: Try running Netscape, PageMaker, FrameMaker, Synamtec C++, Think PASCAL,
: SoundEdit 16, Marathon I & II, etc. and you'll see pretty quick computer in
: the 040 Mac.

Well, not bad - but not exactly what I'd expect, either =(. My 40 MHz Falcon
feels faster, though it definitely shouldn't. It's subjective, but true to
me. I also use both the computers almost daily.

: Don't get me wrong; Ataris are cool, but Macs are the next best thing.

I agree ;-) !

Oh, and all this time I thought that Microsoft were just lousy
programmers :)

You must be talking about the Power Macs which are quite nice BTW. The
Quadras I use in the labs are junk. I have to push the Mac mouse with
both hands to get it inches from where it was before :)

Gee, this sounds a bit famuliar....could it be that the STe and higher computers have a thing can play back samples(and sampled music) without using the CPU? Ah...it's the DMA chip!! :)

Hi there.

I am wanting to get an ST and start sequencing my synth setup.
So far, I've been using my Ensoniq to do the sequencing, but
that is really starting to get old.

What sequencing software is out there for the ST?

I have Master Tracks Pro for my PC, and really like that.

Do they have anything like that?

Basically, anything that can handle more than 8 tracks,
and displays the song with boxes that represent measures?

Also, any information on system specific stuff would be
appreciated. (i.e. if package x only works with so much RAM, etc).

Also, does the Falcon have MIDI ports?
Do all ST's have MIDI ports?

Are there any wave-editing packages out there for the ST/Falcon?

Thanks!

Joe

Yeah, try reinstalling it, if it's unregistered this will fix the problem temporarily, it is crippleware in that after x # of days/hours of usage it doesn't allow usage of any formats that are non-Atari Specific. (And some that are.) I'd also suggest registering if if you use it frequently.
I use it occasionally if I've had an HD Crash and don't have time to run to my PC to use PhotoShow Pro.

(Hopefully will get the Falcon Version soon...)

At any rate, It's quick and easy to reinstall if you copy all the install files to the root directory of the Drive you wish to install it on.

What site are you using for your DNS? I mean, the 'default' one can be very
busy - switch to the Demon one, that should help.

> BTW, can someone give me an FTP address where I can get an up-to

list.

I'm sure Demon will be able to provide you with a list of available
newsgroups, as for ftp there's no _real_ cannonical list - just plenty of
different lists.

2965. Re: How to read Atari's 520 ST floppydisk on my Macintosh ?

Newsgroup: comp.sys.atari.st
Date: 1995-12-03 00:00:00 UTC
From: markvanwyk@aol.com
Message-ID: <49s5jo$e24@newsbf02.news.aol.com>
Source record: 155211
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here's an idea: how about taking a diskette formatted in DOS format (which later model STs can read and write), copy your files onto the diskette, and then use PC File Exchange (Macintosh Freeware) on the Mactintosh to read the files on the Mac . I've done that often. With the newer Macs, you don't even need PC File Exhange with the newer Power Macs - the read both Macintosh and DOS formatted diskettes.

>Anxiously awaiting reply.

Relax, a 68881 will do. And the 68882 feels quite comfortable where a
68881 does or did its job. Later TT models came already equipped with a
68882, albeit in a SMD package, maybe to make servicing more difficult.

So, what are you waiting for? :-)

Check the following:

Go to convert in the file menu, go to the menu that lets you select
the format (this depends on the version), if it lists only a few
formats then it cannot find the files, try re-installing it !), if it
lists formats but most are grayed out then it is due to it being
unregistered, and having passed its 30day trial period. Either pay up
the cash, or re-install it again.

Hope this helps

If you're low on memory, it prints half the screen then goes to the
message "Creating page" whilst thinking about the next half of the
page - really big pages may take more passes: this allows Pgstream to
run on low-memory computers. I got so pissed off with it that I
upgraded to 4 megs and solved this problem.

then
>dthe light above flickers...which tells me there is more....so I press it

Th eprinter is telling you it's still busy - patience is required!!

Wait around a few minutes and it'll pick up from where it left off.

>and then it kicks out the first page...only to complete the second part of
>the page on the 2nd sheet.d
>
BTW are they still selling this program? I got it bundled with a
second hand STE and use it all the time, but I could really use some
updated drivers etc: Deskjet 520 (600*300 dpi), RTF import etc. Are
these now included, cos it always looked reasonably comprehensive.

You'll need some sort of MIDI/guitar controller. Roland makes a
MIDI pickup which fits on most guitars. Casio, Yamaha, Korg, etc. all made
MIDI guitars, which should sell second hand for less than the Roland.
>1_)write out the music as i play >
/Cubase or Notator may do this. Musical notation in real time is
computer-intensive. Piano roll notation in real time is much easier for a
conmputer, and many low-cost programs are capable of this.

> 2_) or act as a computerized footpedal...of course with many different
> sounds...
The Hotz program, which Jimmy Hotz wrote for the Hotz controller,
gives really astounding MIDI mapping possibilities for any MIDI controller.
>
> 3) or both...another thing could be to help in setting up a small midi

I think MagicMac supports Atari harddisks/partitions...
If you haven't heard about "MagicMac" before- it's an opertaing system
that lets you run Atari ST software on an Apple Macintosh, even side
by side with Mac software!
It's produced by Application Systems Heidelberg in Germany and they
have a demo disk available (for the Mac). It's available several
places on the net as well, don't ask me exactly where though.
I guess you could try the usual places: hensa, aaue etc...
Good luck!

Hallvard

Try Ghostlink, you'll find it in the networking subdirectory of your local
Umich Mirror sight.

(I believe it's also available on HENSA)
It basically turns your PC into another HD for your ST over a null modem
cable. (REAL SLOW but it works.)

Can I use GhostLink to access a PC CD-ROM from my Falcon? And can I then
install Linux from CD-ROM on my Falcon?

X11R6 under Linux/68 works fine in 16 colours on TT-med. There are bound
to be other modes in which it works just as well.

The MiNT-X port is currently limited to Mono unfortunatly though.

The Macs use postscript and lets the printer do the bitmapping. This
method is useful when throughput is low.

27 Dec 1986 (C) Anees Munshi 1
Atari RGB to Composite Video Converter
1. INTRODUCTION
The schematic described in this document converts the analog
RGB video signal that is output by the ST to an NTSC composite
signal which can be displayed on a colour or monochrome composite
monitor, or on a TV set by adding a modulator. Please be careful
when building the circuit. Should anything in the schematics or
this documentation seem suspicious, use your better judgement.
A
certain amount of experience at building electronic circuits will
be very helpful. Also, a good oscilloscope and knowledge of the
theory of RGB to composite conversion may be necessary in order
to debug the circuit (should you have to). I have tried to pro-
vide some background in this article.
2. AN_OVERVIEW
The MC1377 RGB to composite video converter IC used does
most of the work in converting the red, green and blue signals
to
composite video. The red, green, blue, horizontal sync and vert-
ical sync signals are taken from the ST and fed into the 1377. A
colour burst carrier (3.579545 Mhz) is fed in from a separate
oscillator [1]. The 1377 generates the R-Y, B-Y and luminance
signals by passing the red, green and blue signals through a
1.
The separate oscillator is not really necessary since 1377
contains a common-collector Colpitts oscillator which can be
used to generate the colour-burst on-chip. However, I found

it easier to generate the signal off-chip to make sure
the
thing is indeed oscillating.
27 Dec 1986 (C) Anees Munshi 2
Atari RGB to Composite Video Converter
matrix. Then, the B-Y signal is modulated using the
colour-burst
frequency carrier, and the R-Y signal is modulated using a
90
deg. phase shifted carrier. This results in the I and Q
(in-
phase and quadrature) components of the chroma signal. The
two
components of the chroma signal are added and amplified and
made
available on pin 13 of the chip. This allows the chroma to
be
band-pass filtered [2] externally and then fed back into pin
10.
The band-pass filter should be centered at the colour-burst
fre-
quency and should have a bandwidth of about 1.6 Mhz. Not
having
a
very good colour TV to experment with, I chose to do an
el-cheapo
filter since it wouldn't make any difference on my set
anyway.
(Besides, I plan to use my board on an old green-screen
monitor
to run an occasional colour-only program). A simple second
order
LC filter may be used. Set the resonant frequency of the
tank to
the colour-burst frequency, and choose an appropriate R so
that
you get the 1.6 Mhz bandwidth [3]. Introducing a second (or
higher order) BPF to do chroma-filtering will probably
result in
2.
If the chroma signal is not band-pass filtered, the low
frequency components it contains (those components
having
frequency less than 2Mhz or so) will interfere with the
luminance signal since it is very hard to put the chroma
specral lines exactly in between the luminance spectral
lines
without any interference between the two.
3.
Note Filter bandwidth = Wo/Q, where Wo is the resonant

frequency in radians/second (Wo=2*PI*3.15 Mhz) and Q is
the
quality factor required. Q=R*sqrt(C/L). A few filters
are
sketched in the Motorola Application Notes if you don't
want
to design one. A reference to these notes is in the
appendix.

a visible delay on the chroma-signal. So, to make sure the
colours are not offset from the B&W image (like in sloppily
coloured comic books), the luminance signal must be delayed
an
equal amount so that the luminance information is not ahead
of
the chrominance information. To allow this, the luminance
signal
is looped out from pin-6 to pin-8. An approprate delay line
inserted between pin-6 and pin-8 will create the required
delay
[4]. The luminance signal does not need any filtering.
3. INTERFACING
The horizontal and vertical synchs from the Atari must
be
combined and fed into the composite synch input of the 1377
(pin-2). The HSYNC and VSYNC are taken from the ST's monitor
out-
put, AND-gated and fed into the comp-sync input. This works
fine
since the syncs are active low, TTL level signals and
satisfy
the
(-0.6V, 0.9V) active and (1.7V, 8.2V) inactive threshold
levels.
The colour signals, red, green and blue must be
capacitively
coupled through 22uF capacitors and attenuated through 2-4
Kohm
resistors (in series with the input) so as to not interfere
with
the chip's bias and satisfy the 1Vp-p signal requirement
respec-
tively. All the three colour signals output by the ST have a
4.
The Motorola Application notes show how to hook up a TDK
delay line if you need one.

1.8Vp-p range with a 1.2V DC bias. 1377 inputs: Pin 3: red

input;
Pin 4: green input; pin 5: blue input.
The colour-burst carrier signal is generated as shown
in
the
attached schematic and coupled to pin-17 through a 2.2Kohm
resis-
tor and a 0.1uF capacitor in series.
The colour-burst is added after every sync pulse,
(burst is
not suppressed after VSYNC) approximately 5.5us
(micro-seconds)
after the sync's leading edge and it lasts for approximately
3us
or 10.7 cycles of the carrier. This timing is done by an R-C
timer in a fashion similar to an LM555 operating in astable
mode.
A 0.001uF capacitor is connected between pin 1 and ground,
and a
51Kohm resistor is connected between pin 1 and an 8.2V
reference
(available at pin 16). When a sync occurs, the capacitor is
unclamped from ground and begins charging through the 51Kohm
resistor from 8.2V DC. When the capacitor voltage reaches
1.0V
(approx 5.5us after the sync), the colour-burst carrier is
gated
on. When the capacitor voltage reaches 1.3V, the
colour-burst
is
gated off. The capacitor continues to charge until the
voltage
reaches 5.0V. At this point, the capacitor is discharged to
0V.
Clearly, by changing the RC values (and hence the
time-constant),
the burst can be made shorter or longer (8 cycles of
colour-burst
is the NTSC spec, but I don't think a slightly longer period
will
hurt (gives the PLLs in the receiver plenty of time to
lock)).
If
the time constant (Time const. = R*C) is increased the burst
will
occur later and last for a longer time. The converse is true
if
the time constant is decreased. If the time-constant is made
too
27 Dec 1986 (C) Anees Munshi 5

Atari RGB to Composite Video Converter
long, the ramp may not reach 5.0V before the next HSYNC,
which
will result in the some missing bursts (not too good). If
you
feel like it, put a 50Kohm potentiometer instead of the
51Kohm
resistor. You may be able to get some cheap special effects
while
calibrating the pot. :-)
A chroma band-pass filter must be introduced between
pins
13
and 10 as mentioned before. You may use the simple bandpass
filter shown in the schematic, or to get better results, use
one
of the many shown in the Application Notes or design one
your-
self. As mentioned before, if you design your own, the
filter
should have a bandwidth of about 1.6-2.0 Mhz and a center
fre-
quency of 3.58 Mhz. Since most colour TV's have a BW around
3
Mhz, the BP filter will help reduce cross-talk between the
lumi-
nance and chroma components (on some TVs, you would never
see
the
cross-talk in all the noise!). If your TV has a comb filter,
you
won't need a fancy BP filter (and the corresponding de lay
line);
in this case, the simple bandpass filter sketched in the
schematic will do.
Again, as mentioned before, if you do insert a fancy
band-
pass filter and see a noticeable shift between the outlines
of
objects and their colour fill, you will need to put a delay
line
between pin 6 and 8. The Motorola Application Notes should
help
in this department.
Pin 20 must be grounded to select NTSC operation [5].
5.
27 Dec 1986 (C) Anees Munshi 6
Atari RGB to Composite Video Converter
Pin 19 provides the reference voltage for the voltage-
controlled phase shifter (needed for I-Q phase shifting). It

must
be capacitively de-coupled to ground through a 0.01uF
capacitor
to provide a stable voltage reference at the pin. By pulling
the
pin up through a resistor to 8.2V, or by pulling it down
through
a resistor to ground, the axes can be tilted to get some
colour
adjustment (about 7 degrees, for a slight effect, according
the
application notes).
A 12V power supply is to be connected to pin 14. The
power
supply need not be regulated.
The 8.2V DC reference voltage appears at pin 16. A
0.1uF
cap between pin 16 and ground will provide adequate
filtering
for
this reference voltage.
Pin 15 is the ground connection.
Pins 11 and 12 are coupled through 0.1uF capacitors to
ground. By sourcing or sinking some current through these
pins,
whites may be made whiter and the blacks blacker (sounds
like a
detergent commercial) by compensating for the balanced
modulator
feedthrough thus.
Pin 7 is coupled to ground via a 0.01uF capacitor.
If pin-20 is connected to the power supply, PAL
operation is
selected. For all you PAL hackers: If you replace the
3.58
Mhz crystal with 4.43 Mhz crystal, and if you have a
properly
serrated vsync, you should be able to use this circuit
to
get
PAL composite. If you do hack and get it working, please
post. (PAL is the colour system used in England, India
and
some other countries.)
27 Dec 1986 (C) Anees Munshi 7
Atari RGB to Composite Video Converter
Pin 9 is the composite video output. It has an output
impedance of about 50ohms. To drive a 75ohm monitor input
termi-
nal, put a 25 ohm resistor in series with pin 9 and a 75 ohm

co-
axial cable. Connect the other end of the co-axial cable to
the
monitor.
27 Dec 1986 (C) Anees Munshi 8
Atari RGB to Composite Video Converter
4. CONSTRUCTION
You will need to buy a colour monitor cable from Atari
[6].
Start by cutting the cable in half. Then, strip about 2
inches
of
insulation off the end of the cable. Now carefully remove
the
shielding without cutting the wires underneath. This should
expose 7 wires. Four of the wires are shielded themselves;
these
are the red, green, blue and audio out wires. Strip the
shielding
off these wires as well. The following is a colour-code
chart
to
help you find the wires:
colour of wire signal pin#
white RED output 7
red GREEN 6
black BLUE 10
yellow HSYNC 9
blue VSYNC 12
green AUDIO out 1
brown ground 13
6.
If this is not available, you may kludge one up as
mentioned
in the Abacus Internals book.)
27 Dec 1986 (C) Anees Munshi 9
Atari RGB to Composite Video Converter
The pins are labelled as follows (looking at the
monitor
output plug from outside). Please test the cable
with an
ohm-meter to see if my colour code is applicable to
your
cable.
pin 4 -> 0 0 0 0 <- pin 1
0 0 0 0 <- pin 5
0 0 0 0 <- pin 9
0 <---- pin 13
Solder the cable onto the board you will be using, then
solder or wire-wrap the circuit as shown in the schematic.

Try
to keep the construction as clean as possible. Keep as much
of
the shielded cables shielded as you can. Try to RF shield
the
whole enclosure if you can. All the best.

Source record: 155271

I am in a hurry for some cash, and I have reduced the price on this system drastically. If you need a new computer, this is an AWESOME system for the right buyer. This is a killer price on a GREAT system, so if you want it, JUMP ON IT!
Thanks,
Jeff Apolis
****
Atari TT030 in a steel tower case... 4 internal 5.25 inch drive bays
500+ meg hard drive installed
44meg syquest drive
TEN megs ST ram,
SIXTEEN megs TT ram... (26total)
TTM194 19inch monochrome
PTC1426 TT color monitor
8 bit color video card (coco)
IMAGE SPEEDER interface to an image setter... VERY FAST lino output!
Keyboard, mouse, docs, box, disks, misc. included.
This is designed as a professional publishing and image retouching system... the system was designed for the DIDOT/RETOUCHE suite of programs which are not included, but easily acquired from various sources.

Software included:
Codehead Utilities, release 3
G+PLUS 1.3
MultiDESK 2.1
Image CAT
Mini Office (Nicely done graphs and stuff, from UK)
OIDS and PINBALL MAGIC (games)
PLUS about a hundred disks full of all kinds of interesting stuff! There are games, utilities, productivity, publishing, database, spreadsheets, all kinds of good stuff!

I was asking $2500 for the whole system without the syquest or the extra disks...
Own it for $1500 before Christmas! This is the STEAL of the year!

Sangrar Waheed (3ws5@qlink.queensu.ca) wrote:
: Hi I have a few question about Linux.
: I understand that it is a Unix based operating system.
: However, can it be used in conjunction with other operating systems like
: Geneva? or Multi-Tos.

Non, it can't... Linux is a Posix compliant Unix clone, designed to run unix applications... It can't be used to run Tos apps: it's a totally new o/s. I haven't tried it on my ST because it requires a 020 or higher and I only have a Mega STe, but I currently use it on my PC and I can tell you that Microsoft stuff is shit!!

: Can it be used to hook up to the Internet, ie web browser, ftp'ing etc?

The internet is mostly composed of Unix machines, so if you run Linux, your machine becomes a Unix machine, capable of doing slip, and capable by the way of doing ftp, telnet, rlogin, finger, graphic browsing... IMHO, Nothing beats Linux for networking!

And as you'll probably realise, Unix is REALLY multitasking and multiuser, which means that you can log with different usernames AT THE SAME TIME (try this on ms-winshit!) or even do real remote access to your machine! Some time ago I was working on my machine and a friend logged in via the modem. He downloaded stuff, compiled a file, etc. and I didn't even REALISED that someone else than me was using my machine!

: Is it full colour.

Unix is basically a text-mode operating system (which is very fast and light). Sure you can assing different colors to your folders, executables files and zip files when you make a ls (equivalent of the dos "dir"). But the GUI itself is not part of the o/s as for TOS or windows... It is a stand-alone interface, called X-Window system... Different freeware window managers are available, such as fvwm, OpenLook XView, Motif (but this one is commercial). They allow you working in a full color graphical interface and run applications such as NetScape...

: I have a TT and I am interested in purchasing it. I really don't know
: much about it however. Any help would be greatly appreciated.

Linux should run very nice on a TT... And, if it's like on the PC, Linux is a FREEWARE product!! Normally you pay only the media! I have the PC slackware distribution on 4 CD's and it costed me 29.95$. I hope it is freeware on the ST too because it's a very good product, very fast and stable, much better than things like minix (which takes 15 minutes to boot on a scsi TT ;-) or FreeBSD (which is not so bad but not so supported!)

If you have more specific questions about Linux, don't be afraid to mail me or repost here! In fact I've never seen the ST version of Linux, but I use the PC version every day and I love Unix so probably I'll be able to answer you...

MiNT is about your only option. No Virtual Memory - but otherwise a quite passable UNIX type OS.

Minix should run too - but I never got it running on my MSTE. Minix was a somewhat better UNIX OS for the ST and PC - and was very much a forunner of Linux. About the only thing of Minix left now is the MinixFS which is available with both MiNT and Linux.

Main problems with Minix is that its commercial and that very little decent software was ever ported to it.

This is wise approach, I think - because the more we can use cheap
PC peripherals, the cheaper and more efficient out Atari-clones
will become.

: Unfortunately, Motorola doesn't produce the 68060 yet at full speed,
: because they are a little to busy wricht now, but the Medusa T60 is
: ready, waiting on his harttransplant... then it will be almost
: the fastest desktop computer in the whole world!

Somebody here will certainly yell: "Pentium is faster, ... is also
faster!" - but I think you mean the speed of _applications_ ?
As we don't have elephants like Windows or MacOS to slow these
computers down, I believe a 68060 Medusa is extremely fast compared
to most other computers. Only in CPU-intensive applications like
spreadsheets, a Pentium-133 has to be faster.

: It is also a pitty that MagiC! does't run yet on the Medusa nore the
: Hades! (it has something to do with the VDI routines) but it will come
: as soon as Behne & Behne have more time and the Medusa and Hades have
: been sold enough..

They should adapt MagiC soon, because many professionals will want it!

: All I can say know is that Fredy Aschwanden is a real genius! I spoke
: with him and the crue of M&W electronics and Atari still has a future,
: only when you all buy these very good computers!!! I know they are
: expensive ($4700 for the Medusa T40 and $2500 for the Hades), but if they
: don't sell, the prices won't slash!

You can get a Pentium-PC for the same price as Hades has - but the question
is: who wants one? I, for one, certainly don,t ;-) ! Why change for

something worse like Windows? And those who like Macs will get ones,
there (fortunately) still is something for everyone available.

: Just hail the fuji again and do as I do, buy Atari stuff and let the
: world know Atari still exists!

I like that attitude, though our permanent "everything is lost, why dream,
let's admit it we lost, Falcon is too expensive, everything is too expen-
sive, stop speaking bullshit..." -guys will probably attack you pretty
heavily, as well as me for supporting OPTIMISTIC opinions =) !

: Any question can still be asked, I have good contact with M&W electronics
: GmbH, and they are the best!
:
: Greetings, Jan Dooms.<jandooms@tornado.be>

Greetings,
Tommi

From: Jan Dooms <jandooms@tornado.be>
Message-ID: <49qq0p$9oh@tornix.tornado.be>
Source record: 155278

Hi,

Just like I did, JH got the MinT Chimera, but I have even
a much bigger problem: it won't even start up on my MegaSTE!!
It gives the answer of:
"
Binding Unix socket: file not found

Fatal server error:
cannot establish unix listening socket
giving up.
file not found (error33): unable to connect to X server
file not found (error 33): Server error
pid 0 (mint): Kfree: memory not allocated by Kmalloc
Fatal MinT error: adjust debug level and hit a key...
".
I think there are some files missing, and I think they came from the
seventh disk, because while installing, some files had trouble copying!

Has anybody had the same problem? Or does anybody know what to to about
this? Well, help me than, please.

Greetings, Jan Dooms.<jandooms@tornado.be>

I was wondering if there was something that I could buy so that i could play a guitar, and a music program(cubase or whatever) would be able to

1) write out the music as i play

2_) or act as a computerized footpedal...of course with many different sounds...

3) or both...another thing could be to help in setting up a small midi studio....thanks....

From: dhedberg@yin.kuai.se
Message-ID: <49t3na$c8p@bundy.mdk.se>
Source record: 155282

: Hadn't realized this. Got out the modem manual and looked up the command
: (&K3), added it to my modem init string. Still no luck though.

Why don't you save the changes to one of the modem's profiles instead?

: No such light on my Supra Fax Modem v.32 bis. Argh, this is so
: frustrating. Downloading Z-modem (or any other way) works fine. But
: uploading always fails unless I revert all the way back to plain vanilla
: x-modem. Any other suggestions?

This really sounds like you're having none flow control active at all or
both Xon/Xoff and RTS/CTS active. Make sure you only have RTS/CTS active.
Check both your setup of the modem and the terminal program, aslo remove
MODEM.CPX from the Control Panel if active. Just rename the CPX file to CPZ.

Hello..

I'm trying to access the Web via the CAB/STIK setup, but when I try and connect a page it says "Resolving host..." but doesn't do anything else.

I have checked my paths and configs and can't find anything obviously wrong.

Has anyone else ever had this problem and solved it.. if do, how?

BTW, can someone give me an FTP address where I can get an up-to date newsgroup list and FTP site list.

Thanks..

Why not? In the early 80's, Atari had "specials" about current
technology where they had nothing but commericals about the 2600 and the
800 computers. They even have a web page with those ads stored as
QuickTime movies :)

> Why is that grim? Sega has done the same thing twice! It's

Well, I tried using HSMODEm with Stalker 3.02 and my Mega 4 STE and I wish I'd known they were incompatible! For the life of me, we couldn't figure out where the errors every 4096 bytes were coming from until I finally disabled HSMODEM and haven't had any trouble since. My efficiency rate on binary transfers tends to be about 84%, on text, 101%. Better may be possible with a 14.4 modem, but downloading and uploading were practically impossible with HSMODEM installed. I HOPE your milage may vary!

From: musicman@pixi.com
Message-ID: <49rusb$esg@rigel.pixi.com>
Source record: 155292

Hello Fellow Atarians:

I just got my Pagestream program in the mail from Soft-Logic a few days ago and was very excited about it at first.

I've run into some problems with the printing.....and the fonts. I think the problem is two-fold at the least.

After completing a page of DTP work with font selection and image importation, etc. and attempt to print seemed okay dthe first time I tried. Then a few days ago....(today) I worked another page of DTP work, but the printer (HP Desket 540) only printed 1/2 of the DTP page on one...then dthe light above flickers...which tells me there is more....so I press it and then it kicks out the first page...only to complete the second part of the page on the 2nd sheet.d

Can anyone shed some light on my situation? I've checked to try to make sure that the page demensions was set up right etc.

Help!

aloha......vern :(

Thanks very much for the response Dan. I'm still having the problem
though. Here's where things stand (I assume others find this discussion
enlightening, I could take it to e-mail if no-one else has a similar problem)

Dan Wilga (dwilga@mtholyoke.edu) wrote:
: The most common reason for failed uploads is (the lack of) RTS/CTS flow
: control. Information is being sent to the modem more quickly than the
: receiving host can process it, and the mechanism to tell it to stop for a
: while is not working. This can be caused by several factors:
:
: 1. Make sure only RTS/CTS is selected in the communications settings
: dialog. If you use the autodialer, make sure it is chosen in the "C"
: button to the right of the appropriate autodialer entry.

OK, did thins long ago. Double checked. It is done.

: 2. Nearly all versions of TOS have some sort of bug with respect to
: RTS/CTS. Use the SERIALFX2 program that is on the STalker disk in the
: EXTRAS folder, if you need it for your version of TOS. More info about
: this is in the STalker README file.
:
: AFAIK, you can use HSMODEM also. I tried it myself briefly and it seemed
: to work fine, I have also had other people tell me it helps things
: significantly. The thread here is the first I've heard of problems using
: it with STalker.

OK, I thought the Falcon didn't have this flaw, but when I bought all the
stuff I did make sure to install FPATCH2 as the README suggested. But I
always had the problem anyway. More recently I also installed HSMODEM
(so I could use STiK), but the problem persists. Is there another
RTS/CTS patch I should be using?

: 3. The modem may not be set for RTS/CTS (what they sometimes call
: "hardware") flow control. You will need to look in the modem's manual to
: find the correct AT command(s) to send, since this varies from one modem
: to the next.

Hadn't realized this. Got out the modem manual and looked up the command
(&K3), added it to my modem init string. Still no luck though.

: If everything is configured correctly, you will probably see the modem's
: RTS/CTS lights blink as you upload (if it has them).

No such light on my Supra Fax Modem v.32 bis. Argh, this is so
frustrating. Downloading Z-modem (or any other way) works fine. But
uploading always fails unless I revert all the way back to plain vanilla
x-modem. Any other suggestions?

: ZModem downloads consistently fail from garbage and checksum errors.

Yes! This is exactly my problem too. I have TOS 4.04, etc.. But this
afflicts me with or without HSMODEM installed! Hmm, unless it was that
I've never tried the unique combination of FPATCH2 in, LED out and
HSMODEM out. OK, I'll give that a try too.

But I'd hate to have to always load HSMODEM in when I want to use STiK,
and not load it when I want to use Stalker! What a drag.

Thank you Michael. You hit the nail on the head. Removed HSMODEM and
now all works flawlessly (except, of course, I'll have to reboot now to
run STiK/CAB or STiK/AntMail, as STiK seems to _need_ HSMODEM).

Seems like we've found something for the Gribnifs to fix for the next
update. BTW, I'd really love to see an iconification button on the upper
righthand corner of my STalker (and STeno) window(s).

By the way, the LED program I referred to earlier that caused my Falcon to
lock up whenever this RTS/CTS problem occured was LED Panel v2.3 by
Christoph Zwerschke.

Hi I have a few question about Linux.
I understand that it is a Unix based operating system.
However, can it be used in conjunction with other operating systems like
Geneva? or Multi-Tos.
Can it be used to hook up to the Internet, ie web browser, ftp'ing etc?
Is it full colour.
I have a TT and I am interested in purchasing it. I really don't know
much about it however. Any help would be greatly appreciated.

You know what kind of program I want to write for my STe? A driver that lets you use the Jaguar powerpads for playing all ST games instead of the joystick. It would be cool if I can get some information on reading the analogue ports and how to hard-write to the keyboard.

It depends _how_ old ST-titles you mean ;-)... Hades and Medusa (& Eagle, of course!) are probably about as compatible as Falcon is. There are still some new Atari programs that dislike Falcon, but not many. Most are simple games for older ST models.

As practically all "serious" programs run on Falcon well, there should be a healthy pile of nice software available for the PowerBirds, too.

3026. GCC program crashes after receiving SIGCHLD

Newsgroup: comp.sys.atari.st
Date: 1995-12-04 00:00:00 UTC
From: josdb@xs4all.nl
Message-ID: <30c2c82483410@xs4all.nl>
Source record: 155161
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

I have a program, compiled with gcc, that crashes after receiving SIGCHLD. I ran dbg on it and it clearly said: "Program stopped with signal 20 (Child Process Exited)". As far as I know, it isn't normal for a program to crash after receiving SIGCHLD, the default is: no action. The program crashes both under MiNT and under normal TOS.

It doesn't matter if I execute the child process with Pexec (mode 0) or the standard lib function system().

Any ideas what could cause this behaviour? And what can be done about it?

The same program compiled with PureC executes flawlessly.

. The program will do real time notation as you play the MIDI instrument.
The MIDI ports can only to be connected to MIDI cables and MIDI ports from MIDI instruments.
A pitch to MIDI is needed to imput midi data and doing automated notation. A Photom Guitar MIDI converter uses a channel or pick-up for each string and can be used with electric and acoustic guitars with metal or nylon strings. the photon is about $1000.00

I hope this helps. (I am a professional guitarist and Photon dealer)

> I have just tried to boot from two different Quantum Fireball 1080 SCSI
> hard drives.

As I read in the german Maus-net, you can't run Fireball and Empire HDs from Quantum on STs (and all other SCSI-drives which require Initiator Identification - often referred to as Bus Arbitration) because they need to get a response from the host adapter - which they unfortunately don't send. The same is true for ALL (AFAIK) Conner hard drives because they cannot switch off Parity checking - this means you have to have a host adapter that handles Parity. So be sure to check your hardware BEFORE you buy a hard disk - especially SCSI-2 - when you have an ordinary ST(E).

So long,
Hampf

3029. Information request: Guitar and ST

Newsgroup: comp.sys.atari.st

From: The Scotsman <david-f@easynet.co.uk>
Message-ID: <30C2F31B.7299@easynet.co.uk>
Source record: 155164
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a small request for information.

My mother plays guitar at a local church. She is starting to compose her own songs and tunes, and is looking for a way of translating her music into sheet music notation. Since she is a self-taught guitarist, and can neither read nor write sheet music, this is a wee bit problematic.

It has been suggested to me that an Atari STFM could be used in this context: that you could plug an acoustic guitar pickup into the MIDI socket and play the music into the computer, which would then translate it into the required notation.

This sounds like a wonderful idea, but I need to answer a few questions before I can go ahead with it. Can you help me with any of them?

1) Does the Atari have software available that can translate MIDI to sheet music?
2) Does the ST have the hardware necessary to interpret guitar sounds and turn them into sensible notes?
3) How much would a decent second hand ST cost, and where would I find one (in the UK)?

-- David F.

3030. HP660C printer

Newsgroup: comp.sys.atari.st

Does anyone know of a program that will allow me to use my HP660C printer to print coloured pictures? I use 'CANVAS' , but this only drives a dox matrix!
Thanks Brian

drives.
m>

m> Once the drives have spun up, they appear to remain spinning
for
m> about fifteen seconds and then spin
down.

Do they make the usual SCSI chattering noises? It sounds very much as though the drives are failing their POST (Power On Self Test). This is serious!! Have you seen them working ever
before?

m> When I run the driver software it sometimes spins back up,
othertimes
m>
not.

Drivers will often send a "Start Unit" command in case the attached drives have been configured to wait for spin up until told
to.

m> Does anyone have any thoughts as to the reason why this
is
m>
happening?

The most common cause of failing POST is that the drive does not come up to speed (or the servo is bust and does not detect that the drive IS up to speed). What sort of power supply and power connector have you got? Any chance that there is a high resistance in the 12v path which will prevent the drive motor coming up to speed? Are BOTH centre connectors to the PSU connected? Some drives have separate returns for 5v and
12v.

m> It is being used on an Atari computer with SCSI host
hardware
m>
installed.

Hmm ... if it's what I think it won't matter WHAT it's attached
to!

m> Testing three differnt computers and three different drivers
still
m> turns up the same (failing) result. The driver software does
not
m> recognise the drive
exists.

This is consistent with drive failure but it's suspicious that BOTH fail to
pass POST. This is what makes me suspect the PSU or
connector.

These Fireballs aren't "differential" are they (sorry I don't have their
specs)? If they are they will not like the way ST host adapters connect odd
pins to
ground.

I've a feeling you ought to be looking to get your money back
:(

3032. Notator from Emagic and Photon MIDI Guitar Converter

Newsgroup: comp.sys.atari.st
Date: 1995-12-04 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <49vc9r$j5j@huron.eel.ufl.edu>
Source record: 155167

. The Notator Program from Emagic program will do real time notation as you play the MIDI instrument. The MIDI ports can only to be connected to MIDI cables and MIDI ports from MIDI instruments. A pitch to MIDI is needed to imput midi data and doing automated notation. A Photom Guitar MIDI converter uses a channel or pick-up for each string and can be used with electric and acoustic guitars with metal or nylon strings. the photon is about $1000.00

I hope this helps. (I am a professional guitarist and Photon dealer)

>
> I have Master Tracks Pro for my PC, and really like that.
Passport stopped developing MasterTracks for the Atari at ver 3.6 That's what I use, and find it to be very effective. I can be a musician, not a technician. If you're already used to it, I'd suggest searching out a second-hand copy from someone who has "graduated" to a more complex sequencer such as Notator or Cubase.
> Basically, anything that can handle more than 8 tracks,
> and displays the song with boxes that represent measures?
Yes, it does.>
> Also, any information on system specific stuff would be
> appreciated. (i.e. if package x only works with so much RAM, etc).
MT will work fine on 512K RAM!
>
> Also, does the Falcon have MIDI ports?
> Do all ST's have MIDI ports?
Falcons and ST's all have MIDI ports. The Falcon has much more, including a higher price.
> Are there any wave-editing packages out there for the
ST/Falcon? >
Yes, there are. I believe Avalon is a generic sample editor/librarian, and there are no doubt others. I've seen postings recently for a thing called EPPS, from Sweden, which sounds as if that's what it does.

Hi there!

I am a PC Linux user, and I also am a Mega STe user. Currently I use the machine mostly for DTP and music (PageMaker and CakeWalk really sucks ;-) but I'd also like to run Linux on... Obviously my 68000 can't run it, but I've heard about a thing called PAK/030, which seems to include a 68030 and a FPU... How much does it costs? Who sells it?

Hello,
a friend of mine has some problems with his TT-RAM card. This card comes from Atari and this references are:
-on the components side: CA400312,
- on back: C300724-001 rev 1 GX B-VO 3490

On components side, there are 3 removable straps W1, W2,W3.
Can anayone write me what is the signification of this straps.

This card has been modified to 16 Mbyte when my friend bought it. He wants to configurate this card to 4Mb.

Thanks

Best regards

There is a spare rubber cup thing under the return key, this seems to
have two for some reason. I had problems with my space bar so I just
took one from under the return key and put it under the space bar,
everything works.

Not much use if you have more than one missing - but maybe a help?

Aarrgghh!! Then my stinking PeCe did't post it to the newsgroups!?
Still I saw my letter appearing in the newsgroup when I fetched news
the next day, so perhaps it is on its way? Or it is gone forever...
If you don't see it appearing today or tomorrow, please post it
public, that was the whole idea anyway :-)

> Does this version now work as an accessory on a TT with FASTRAM... I
> could only get the EPSSATOM (0.55) demo to work this way by disabling
> TTRAM with 24bit.prg.

Aha, thats seem to be an interesting bug! I have never been able to
test it on a TT with fast-Ram actually, because mine only had 4MB ST,
but I will soon mount a FX-card in my new MK-I, so I will then be able
to fix the bug, as the FX's ram should work the same way as TT-RAM.
Thanks for pointing it out. (It could already have been fixed in the
v1.01actually, but I have never got any feedback indicating either
way.)

> the bank transfer... presumably I need to email you the information seperately?

:-) No, thats OK. I would appreciate if whoever pays the shareware
fee, also send me some indication that he had done so, in form of a
letter or e-mail. Although I see the sender on the receipt I get, it
does not normally tell the address, as you say, so I need the address
to ship the program.

I send this as a e-mail to you only, but please post this too if I
don't get my newsagent to work...:-)

>jason

OK, lets clear some things up:

1) There are indeed distributors for Zero-X in the UK, in fact even
two: Digital Village and System Solutions, so if you are interested in
the program, please turn to them. I know they have resellers in all
over the country. In fact we have distributors for Zero-X in almost
every european country + US.

2) I dont have any distributor of EPSS, buts many people have payed
the shareware-fee and got their registered versions of the program
together with a lot of songs and patches. The current version of the
program is v1.01 and it works for STe/MSte/TT and Falcon. It is a
little bit enhanced for Falcon concerning the look, but no special
16-bit sound or usage of the DSP yet (see below).

3) You ask how you pay money to the Potal Giro Account. It works
exactly like transferring money to a bank account, with the name of
the bank beeing 'Postigirot Utland, Sweden', the account number beeing
4284870-5 and the company name 'Copson DATA'. All of our Zero-X
distributors pays this way from all over the world and it works
perfectly.
The currency mentioned in the info-box of EPSS is SEK, which means
Swedish Kronor, which in fact is the currency used in Sweden. Not so
hard to guess I think... :-). Anyone who wants to register, please

skip the post and package... Special Christmas offer :-)

4) Concerning further development of the EPSS: I am currently fully occupied writing Zero-X together with Peter Segerdahl of Vinga System, and I simply don't have the time to work with both programs. Zero-X is aimed at the professional and semi-professional market which also makes it more rewarding to spend my programming on Zero-X rather than EPSS, but perhaps in the future I will continue with EPSS and make it like a complementing program for Zero-X...

5) DSP-drivers for EPSS is currently in work by a Hawaiian EPSS-enthusiast named John Perez. I don't know the current status, but the last thing I heard from him was that he just had started coding the DSP-routines, so we will se what happens.

Yes i know this problem, maybe you should change something in the default.cfg.
here is my part for this:

```
# TCP paramaters. Don't change without advice from a TCP freak :-)
# If left unset, they default to hardcoded (sensible) values.
# DFB_SIZE should *never* be less than 580.
# Originale behind # (here inside) and the rest ist testet.!
TTL = 64
PING_TTL = 255
MTU = 1006 #(252);552;
MSS = 966 #(212);512;1460;
PKT_SIZE = 2048 #(256);1024
DFB_SIZE = 1024 #(580)
RCV_WND = 4096 #(2000);2048;4096;3864
```

MTU is most important and is given from your host !
MSS is MTU -40
and all other you must test it by your self, maybe more bigger more fast !?

>
>I have checked my paths and configs and can't find anything obviously wrong.

I had a fairly similar problem with my Fireball, it would format, partiton be recognised & pass bad sector tests perfectly but should you write anything to it it would fail miserably and I was told (not very sure I believe it even though it was said by the company who I bought it from) that if a Fireball is used on another computer then it is useless on the Atari range! I have heared of other problems too but personally I don't think you can fix this, sorry!

> umich) can I get this stuff, is there a mirror at hensa ??? if so
> where ? any other mirrors in the Uk ???

the official UK mirror is

src.doc.ic.ac.uk:/packages/atari/unich

but it was ,and I think still is not being kept up to date ATM due to a shortage
of disk space at src.doc ... allegedly , can someone clarify that ??

In message <49uu2d$rt3@melimelo.enst-bretagne.fr>, derennes said:

>a friend of mine has some problems with his TT-RAM card. This card comes from
>Atari and this references are:

>-on the components side: CA400312,

>On components side, there are 3 removable straps W1, W2,W3.
>Can anayone write me what is the signification of this straps.

W1 & W2 control the fast RAM starting address, for $0100 0000 you should have
links on 2 to 3 on both W1 and W2.

W3 should have a link on 2 to 3 for burst mode.

>This card has been modified to 16 Mbyte when my friend bought it. He wants to
>configurate this card to 4Mb.

Has he considered trying to part exchange it for an unmodified 4MB board?

email me details of the modification, and I'll let you know how to restore the
board to it original spec.

Is this from cold, or from a reboot?

I have had problems with these drives failing thermal
recalibration on a cold boot. Each time the cure was to get rid
of the delayed start jumper, power up the machine, and leave it
running for ten minutes before trying a reboot.

This was on IBM-compat PCs however. YMMV.

> set-up, is there a LaTeX add-on for it?

IIRC, it's included in the package. At least in the one on
atari.archive.umich.edu it is.

> Failing that, is there a decent version of LaTeX that I could run
> from my (old TOS 1.0) machine?

I've been running LaTeX on my old 1.0 ST without any problems. Your
harddisk will probably need a minimum of 5M (depending on the number
of fonts you will use), though.

Regards, and Happy TeXing!

No, it is not part of the OUTSIDE distribution. But it was already
explained that you don't need any additional software to turn the MiNT
memory protection off. Rename MINT.PRG to MINTNP.PRG, that's all.
You can't turn on memory protection afterwards.

Which AW writers are doing this? certainly not me...

IMHO, if any of the Atari mags go, it will br both of them... not just
one. Also IMHO, one cannot survive without the other... with only one
mag left, people will automatically think that the market is dead and
thus move onto other platforms, so less and less sales for the last
surviving mag, which will have to fold.

: ST Format is just about the only Atari magazine out there(that still
: supports Atari machines at least). I hate to see them go away. It's
What! Eric, I can't believe you are saying this... does AW not support
Atari machines? Why do you think it doesn't?

3056. FS. Matrix Coco card

Newsgroup: comp.sys.atari.st
Date: 1995-12-04 00:00:00 UTC
From: dave <dave@mbha.demon.co.uk>
Message-ID: <818066907snz@mbha.demon.co.uk>
Source record: 155191

Subject says it all really. I have a Matrix Coco card for sale. Good condition, works really well. Gives the following;

1. 2/16/256 colour at 800x608 and all standard ST resolutions
2. 2/16 colour at 1024x768
3. VME connection for STe & TT
4. Comes with NVDI 2.51 (special version)

I have been very happy with it, it sure gives a new dimension to the standard screen res.

PRICE: first offer over 170UKP gets it. I will pay carriage.

Source record: 155226
Cross-posted to: news.announce.newgroups,news.groups,comp.os.linux.development.system,comp.unix.amiga,comp.sys.amiga.applications,de.comp.sys.amiga.unix,maus.os.linux68k,comp.sys.atari.st

```
LAST CALL FOR VOTES (of 2)
unmoderated group comp.os.linux.m68k

Newsgroups line:
comp.os.linux.m68k Linux operating system on 680x0 Amiga, Atari, VME.

Votes must be received by 23:59:59 UTC, 18 Dec 1995.

This vote is being conducted by a neutral third party. Questions
about the proposed group should be directed to the proponent.

Proponent: Chris Lawrence <lawrenc@cs.rose-hulman.edu>
Votetaker: Steve Bonine <spb@ntrs.com>

RATIONALE: comp.os.linux.m68k

Current traffic on the dedicated Linux/m68k mailing list is
approximately 25 posts/day. In addition, there are about 5 posts
relating to Linux/m68k per day in comp.unix.amiga, and at least 20
posts per day in the multilingual maus.os.linux68k newsgroup, which
does not propogate very widely. Interest in the Motorola 680x0 port
of Linux is growing substantially, and there is no Usenet-wide group
at present that fulfills this need.

CHARTER: comp.os.linux.m68k

The group comp.os.linux.m68k will not be moderated. It is intended to
further interest in, and development of, the port of the Linux
operating system to the 680x0 architecture. It is anticipated that
almost all discussion in the newsgroup will be in English.

END CHARTER.

HOW TO VOTE:

You should send E-MAIL (posts to a newsgroup are invalid) to:

voting@ntrs.com

Check the address before you mail your vote. Your mail message must contain
one and only one of the following vote statements for each group:

I vote YES on comp.os.linux.m68k
I vote NO on comp.os.linux.m68k

You can also vote ABSTAIN or CANCEL. These votes are not counted in the
results, and CANCEL removes your name from the vote listing in the result.
```

Names are required for this vote. The counting software will extract your name from the mail message if your mailer is properly configured; if your mail software does not indicate your real name, you must include the following statement and add your name (on the same line).

Voter name:

Vote counting is automated. Failure to follow these directions may mean that your vote does not get counted. If you do not receive an acknowledgment of your vote within three days contact the votetaker about the problem. IT'S YOUR RESPONSIBILITY TO MAKE SURE YOUR VOTE IS REGISTERED CORRECTLY.

If you wish to change your vote, simply vote again from the same account; duplicate votes are resolved in favor of the most recent vote.

THIS IS NOT A SECRET VOTE. Names, addresses, and votes will be published in a RESULTS article in the same newsgroups in which this CFV appears.

The purpose of a Usenet vote is to determine the genuine interest of persons with Usenet access who wish the proposed newsgroup to exist. Soliciting votes from disinterested parties defeats this purpose. Please do not distribute this CFV. If you must, direct people to the official CFV as posted to news.announce.newgroups. Distributing pre-marked or edited copies of this CFV is vote fraud. When in doubt, ask the votetaker.

Standard Guidelines for voting apply. One person, one vote. Votes must be mailed directly from the voter to the votetaker. Anonymous, forwarded or proxy votes are not valid. Votes mailed by WWW servers are considered to be anonymous votes.

DISTRIBUTION:

In addition to the groups named in the Newsgroups: header, the CFV and the eventual RESULT posts will be mailed to the mailing lists:

linux-m68k@phil.uni-sb.de
To join, send mail to majordomo@phil.uni-sb.de with a blank subject and the line "subscribe linux-m68k" in the body.

comp.os.linux.m68k Bounce List - No need to revote

I have just tried to boot from two different Quantum Fireball 1080 SCSI hard drives.

Once the drives have spun up, they appear to remain spinning for about fifteen seconds and then spin down.

When I run the driver software it sometimes spins back up, othertimes not.

Does anyone have any thoughts as to the reason why this is happening?

It is being used on an Atari computer with SCSI host hardware installed.

Testing three differnt computers and three different drivers still turns up the same (failing) result. The driver software does not recognise the drive exists.

Doing the same with other SCSI devices works all right.

Hello David,

The answer to your first question is yes. I have a MIDI package which I am sure will translate MIDI into sheet music. I will check to be on the safe side.

The answer to the second question, I am not sure that the ST can do this. As all the music packages will use the MIDI ports, And for this the guitar will need to produce MIDI output.(which can be done but is expensive) (Please correct me if I am wrong anyone)

And for the third question I am selling an Atari 1040STE at the moment with all relevent packages. I live in Coventry and Kent.

Please E-mail me if you have any questions : email: student%cvhp152@ncp.gpt.co.uk

Welcome to the Quantum Fireball club (Actually I sent mine back for a
Trailblazer 850). I went through this problem just last month.

The problem is called bus arbitration. Bus arbitration is where the drive
must ask permission to use the SCSI bus. Since the Atari hardware does not
support bus arbitration, the drive never gets permission to use the bus and
you can never use such a drive for boot purposes.

However, with the right hard disk driver you can use the Fireball AFTER you
use another SCSI device to boot with. The jist here is that once you have
a "bus arbitration aware" driver loaded, you can use the Fireball...but the
only way to load that driver is via floppy or a SCSI device that does not
do aribitration (i.e., most SCSI-I or SCSI-II devices).

As history, bus arbitration has been in the SCSI specifications for some
time (maybe even since the beginning), but nobody has implemented it until
now, and even still the Quantum Fireball is the only SCSI-3 device that I
have heard of that does it.

In short, either get a driver like HDDRIVER that support arbitration, in
which case you still can't use the drive to boot, or return it and get
a different drive.

Maybe others can contribute/correct this thread, since they helped me with
this problem earlier this year.

Saying that a Mac 040 is equal to a machine that is designed for an 060 is like putting a turbojet on a cesna and thinking you can take on an F-16. Get serious, will you?

- Who do you think?

From: 3ws5@qlink.queensu.ca
Message-ID: <49v5pm$dqt@knot.queensu.ca>
Source record: 155240

Does anyone know anything about tt ram?
Here are some of my problems
NeoDesk does not recognize.
Dynacadd (2.04) does not recognize, even after setting the proper flags.
Calamus SL does recognize it, but there is a high frequency buzzing sound
every time I activate a menu at the top of the screen.
Tos 3.06 recognizes the ram at boot up and tests it. Everything checks
out O.K.
Also, can I install more St Ram on my system? If so what type?
Could all this be a problem with some Patch or something?

>I don't think that memory would be the problem ;-)

You've got a good point there. ;-)
I've never tried DVIEW on an ST myself, but a guess would be that the
frame rate would be around 0.5fps at 320x200. Decreasing the screen size
will of course help that, especially for 'simple' areas like corridors.

The amount of memory will vary with the WAD and level you wish to try.
Since DVIEW only loads the map structures, not that much memory is
really needed. I would be surprised if it didn't run in 2Mbyte, and even
1Mbyte might well be enough.

As the name suggests, DVIEW does only allow you to _view_ DOOM WAD levels.
You won't find any monsters or objects and there's of course no texture
mapping. The same holds true for the full BAD MOOD 1.32alpha, but that's
a lot quicker and better in most ways.

Source record: 155246

Hi,
I have a *weird* problem with my MegaSTe. Last night, for no apparent reason, my CONTROL key stopped working. I thought the keyboard was faulty, which was very very unlikely. Anyway, a long story cut short: the keyboard was fine, after removing then replacing my hard disk.

Now, everything works as before, except... If I park the hard disk, I can't boot off the floppy drive (get four bombs), unless, it has an executable boot sector (e.g. like many a game or demo). If I physically remove the hard disk, that problem goes.

Anyone know what the hell's going on???!!! My setup:

HARDWARE
----
* MegaSTe 4/540 (Quantum Maverick 540S with standard Atari internal host adaptor)
* TOS 2.06
* Double density floppy drive

SOFTWARE
----
* NVDI 3
* HD DRIVER (the one before v4.5 or whatever the latest release is)
* Shitloads of irrelevant stuff

This strikes me as totally bizarre. Everything is fine except for this booting problem when the hard disk is parked and still plugged in. I only got the HD in July and the whole caboodle has functioned flawlessly since. UVK 6.0 tells me I have no virus infection, and I personally think it's a hardware fault, but why?!? Why so sudden and why so obscure??

Any help appreciated (it's not a major problem as far as being able to use the machine is concerned but it sure does bug me!)

S.Lai

> : it with STalker.

Yes, I must have missed that you were using a Falcon. From my tests, RTS/CTS seems to be OK on the Falcon. The only patch you definitely need is FPATCHx.PRG. The authors of HSMODEM say that even the Falcon's serial routines are not fast enough, though, so supposedly HSMODEM increases the throughput.

> (so I could use STiK), but the problem persists. Is there another
> RTS/CTS patch I should be using?

HSMODEM and the ones included on the STalker disk are the only ones I know of that usually work well. Of course, there probably are others.

Given the comments here about HSMODEM and STalker on a Falcon, I will make sure to preface suggestions of HSMODEM with the comment "it has worked for some, not for others" <smile>.

> Hadn't realized this. Got out the modem manual and looked up the command
> (&K3), added it to my modem init string. Still no luck though.

One suggestion: some modems have separate options for received and sent data. Make sure you got them both. You should probably also follow the suggestion someone else made and permanently save this setting into the modem's configuration.

Aside from that, I'm afraid I've run out of suggestions. About the only (unlikely) possibility left is that perhaps the cable you use does not have the RTS and/or CTS lines in it. You might want to see if you can trace the appropriate pins with a continuity tester, or just try another cable.

> Hi I have a few question about Linux.
> I understand that it is a Unix based operating system.

Correct

> However, can it be used in conjunction with other operating systems like
> Geneva? or Multi-Tos.

ATM no , you choose to boot either tos or linux but there is some work being done on a TOS emulator but I doubt if it will ever get to any stage when you would want to use it in place of native TOS ..

> Can it be used to hook up to the Internet, ie web browser, ftp'ing etc?
> Is it full colour.

Sure can , the main reason I got interested. Very flexible tool for navigating the net . X windows runs in colour and programs like Mosaic are available so it is way ahead of all the Tos stuff.

> I have a TT and I am interested in purchasing it. I really don't know
> much about it however. Any help would be greatly appreciated.

You sound like me about 6 months ago .. interested but completely without any knowledge . I am having a LOT of fun with it now and am glad I took the leap in the dark , I recommend getting the Atari Linux Distribution (ALD) CD as a painless way to get all the files and an initial install that works (99%) and lets you as near as damn it plug and play ... but also contains just about every FAQ and Text file related to linux that you could find in months of browsing the archives.

Hi,

On 28 Nov 1995 20:51:32 GMT, Michael Ellis (michael@anest4.anest.ufl.edu) wrote:
: It sounds to me like you are formatting a HIGH DENSITY disk as DOUBLE DENSITY.
: You shouldn't do this because the HD disks are physically different than the
: DSDD disks. Always use DSDD disks when transferring files from the Atari to
: a PC.

Actually you can format a HD as a DD just but you need to cover up the
small little window on the top left hand corner of the diskette. I use red
masking tape to tape it up but you can use anything as long as it is opaque.
I've used the disks this way since January and the data is still intact.

Great Days Ahead,
Chugn Yong

Systems Solutions sell it in the UK for
£40.

If you don't mind the DTE speed being locked at 38400 there is a cheaper DIY mod at around £2. You just need a 4040 IC and a switch (to revert to normal).

You're right. I find that starting Word 6 on a PPC is very slow for a
native application. Excel 5 is quick. Some rumours say that Microsoft has
set empty loops in the code for slowing the Mac version.
I recently received a message : someone installed Soft Windows on his PPC
and Word is quicker in Windows emulation than the Mac version. So it's not
the machine, it's really the version.

I've a Falcon and a PPC 7100. The Falcon has very good sound, the PPC too,
but Marathon II is great, and native applications are very quick (and
pretty). I had a TT and had to buy a Falcon for some jobs. And I find the
Falcon is slow, slow... TT was a really good machine.

> guitarist, and can neither read nor write sheet music, this is a wee
> bit problematic.

There is a MIDI device called the G-Box(or G-Vox) which picks up on the guitar sound and sends the right data signal. Since it is a MIDI device, you should be able to use it on an ST but you have to get seperate software for the ST(like a sequencer) since G-Box comes with PC software only.

> 1) Does the Atari have software available that can translate MIDI to
> sheet music?

I'm sure there are programs like that out there but I don't know any persoanlly. Any takers? :)

> 2) Does the ST have the hardware necessary to interpret guitar sounds
> and turn them into sensible notes?

MIDI only works with digital computer data, not with actual audio sounds.

> 3) How much would a decent second hand ST cost, and where would I
> find one (in the UK)?

You can check ST Format, they have a thing in the back with second-hand ST's being sold. I hope this helps...

S>Yes, but does anyone make any software currently for the Medusa/Hades?
S>
S>Will they run all the old ST-Titles?

Nearly every ST-software runs on the Medusa. Exceptions are old binaries compiled with the omicron-basic, gfa-basic based programms work! Most games doesn't work on the Medusa, the Medusa has a graphiccard! The HADES is still in development, so nobody can say anything about the compatibility. At the Protos only two small demoprograms are shown, but for a developmenttime of round about 6 weeks it was a great thing!

YES and no. You can mix your SIMMS about no problems but when you put your SIMMS
into the machine they do not exacly go in as most people would call pairs. They
actually go into the alternate slots ie 1 and 3 or 2 and 4 NOT 1 and 2 or 3
and 4. 2 meg is perfectly possible but on STe's if you want 2.5meg you will need
a small patch which I will uuencode to you if you want it.

Actually for once it wasn't STF which were the follish ones they knew it was a
full comercial packaga and they had licenced it from then UK distributors (Compo
IIRC) and all was fine BUT apparentl parts of it were sort of 3rd party bits and
as such unwarrented to be used on a cover disk, it was something like that but
certainally not "Oh arabesque....is that PD? Ohh chuck it on anyway!".

I didn't mean the magazine was rubbish, just the game demo on the disk.
I love ST Format, it's been there during myt time with ST computing. I
used to buy it every month but since money is tight I'll only buy it if
it has good stuff on the coverdisk. I just wish they could put better
stuff on the coverdisk, like real good PD and shareware programs. I
never thought the magazine was rubbish before I bought, why would I waste
my money?

> > Quite why anyone would buy ST Format instead of Atari World I have no idea

Because ST Format is my choice is is IMHO a better magazine. They done
very good despite the decline of the ST in Great Britian.

Thanx, I think I will once I've picked up on ST assembly. The thing is I
have to buy a copy of the Atari Compendium from someone. I wanted to get
one from Toad Computers, but they stop printing it and put the whole
thing on CD-ROM. I don't even have a CD drive for my ST :(

But I'll give it a go, I came up with this because I couldn't get the
Sega pads to work on the ST. Thanx for the encouragement :)

It naturally runs very nicely on VGAs as well (that's what I have).
We're not programming 'demos' here. ;-)

>I have a link to Johan Klockers Web Pages (who is co-ordinating the projects),
a
>so check out my Web pages ...

I'm not the coordinator, I just happen supervise and host the Web page, ftp
and mailing list.
You can of course go directly to my page (see .sig), but cruising around a
bit never hurts. ;-)

>Does anyone know if the program works on accelerated Falcons ???

A person on the mailing list has reported twice the speed on a Falcon
with an FX card. IIRC he was running at 40/20MHz with fast RAM and with
50MHz for the DSP.

We won't write anything that'll refuse to run on accelerators.
BAD MOOD on an '040 should be impressive...

> it need?
>
>
> Ian_Taylor@a2w.maus.de

Well not quite ... it allows you to view Doom 1 WADs on a variety of machines including the 'old' 68000 machines ...

For those with Falcons the uprated version is now called Bad Mood and is at the alpha version stage, running on RGB monitors in True Colour ...

I have a link to Johan Klockers Web Pages (who is co-ordinating the projects), so check out my Web pages ...

The early versions of Bad Mood look very imopressive, esp as the DSP gives a good performance boost.
Does anyone know if the program works on accelerated Falcons ???

I think Ghostlink can read any PC drive including CD-ROMs on a GEM partition, but your stuck with the baud rate of the serial ports. It's not much different than using a null modem to transfer files between computers. Just remeber that you can't run programs directly from Ghostlink.

BTW, I hope the author would fix this as well as include MIDI transfer between the ST ports and the sound card :)

This isn't a direct answer - but is probably close enough for your
use - the figures are from a 1.2M jpeg - not sure its resolution/
colors: on unaccelerated Falcon - about 1 minute 20 seconds
on unaccelerated Falcon using DSP code - 7 seconds

> -What sort of speed does it play MPEGs at?
No comment, no experience

At least one of the user groups in suburban chicago is called SCAT (Suburban Chicago ATarians.) It meets on the 3rd Tuesday of the month at COD (building K room 1057) from 7:30pm-9:30pm (setup at 7:00)

College of DuPage - building K is just west of the corner of 22nd(called college ave around COD) and Lambert Ave.

Our December meeting is Dec 19th and is our annual Christmas party and auction. Bring a treat to share, any hw/sw that you want to have auctioned off. Part of the proceeds of the auction go to the Chicago Tribune 's supported charity - Children's fund (but I forget its official name.)

Club president is Nick Dimasi - he can be reached at:
quake.xnet.com!vpnet!nickd.

Reply to this message and I will send the BBS number (don't have it handy right now.)

From: kdw3@student.open.ac.uk
Message-ID: <memo.317427@cosy.open.ac.uk>
Source record: 155027

Hi,
In my quest to find the control code sequences for my OKI ML320 printeer, I emailed OKI themselves... they kindly (!) sent me the entire Microline 32x Technical Reference manuals as a uuencoded zip file (Anyone ever had a 1Mb email ??!!)

However, they state that the file is in 'Adobe Acrobat' format.

Now, I've got a large binary file containing the data I want, with one small drawback... I can't read the damn thing !

So... does anyone know of a prog that will read it on my ST, or a prog that will convert it to ASCII ?

Cheers !

Kev.

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

i tried to install gnu c++ (version 2.5.8) on my standard falcon (4MB ram)
and have some problems.

1. i use towsin14(?), tcsh (from tcsh.zoo) and vi (elvis17.zoo)
when i start vi in the tcsh then i cannot move the cursor with the
cursorkeys. Does anybody know why this doesn't work?

2. after the installation of gnu c++ i wrote a test programm hello.cc with
one includefile and one output line. when i try to compile this i will
get a message similar to this: "virtual memory exhausted".
after starting MiNT, TOSWIN and tcsh i have around 2MB of ram left. Is
that not enough or is there an error in my installation?

if it's not possible to use gnu c++, is there another c++ available for
the falcon?

please answer also with email, because i cannot always get this newsgroup.

thanks in advance

Patrick

3115. New problem with Stik

Newsgroup: comp.sys.atari.st
Date: 1995-12-05 00:00:00 UTC
From: markuss@sim.techem.ruhr-uni-bochum.de
Message-ID: <4a1cqs$51c@sun168.rz.ruhr-uni-bochum.de>
Source record: 155104

Hello all !

As many people, I have some problems with Stik. But not the same like other
people here. The problem only occur, if I want to use CAB. IRC works fine.
I have checked the posting in the Usenet, but their problems (setting
of the Cache-directory, uncompressed SLIP) doesn't fit here.
First I describe the problem that occurs:
If I try to load some pages, CAB stops reading the data of the page or an
inline-graphic after around 1600-1700 bytes. Then after a while CAB continues
to load the next document (seems to be a time-out). The error occurs always
with the same document or graphic. So a document does always work or doesn't
work always. IRC works fine.
Second I describe my system:
I have a 520STM, 2,5 MB, HD, 38400 Baud. Software is Overscan, NVDI3, and
HSMODEM6. But the error is the same even with only Stik and HSMODEM. I'm using
the www08.zip archive. The next is a part from my default.cfg:

```
TTL = 64
PING_TTL = 255
MTU = 576
MSS = 536
PKT_SIZE = 2048
DFB_SIZE = 2048
RCV_WND = 2048
```

My Atari is directly connected to our server, a 486DX100 with Linux, over a
uncompressed SLIP-connection. Connection over a terminal works fine.
Third I describe our trys to resolve the problem.
I have talked with our system-administrator about this problem and we have
checked the packages, which are sent between the computers, and tried
different settings of the default.cfg. We have found the following:
The server sends packages with the size of 536 and the atari sends packages,
that he have get them. The window-size decreases every time. After around
1600-1700 bytes, there is only a small window-size left (e.g. 191 bytes).
The server then sends a package with this smaller value, but the Atari
doesn't respond to this. Then the server sends this package every few seconds
again, but the Atari never sends a message, that he have get them.
We have tried other values of MTU, but no changes.
We have tried other values for RCV_WND, but the window-size the Atari sends
to the server is always 2000 !
Our Administrator told me, that there have been the same error in the first
Linux-versions and he have corrected this (he is one of the developers for
Linux).
Does other people have seen this error, too ? Or does somebody knows, what
to do ?

Bye, MarkusS.

Sounds like a config file problem
Are you using the ones I uploaded to ftp.demon.co.uk?

>I have checked my paths and configs and can't find anything obviously wrong.

Mail me them to nick@flinny.demon.co.uk and Ill sort them for you.

>Has anyone else ever had this problem and solved it.. if do, how?

Well not having seen your config files I cant say anything but since your
provider is demon and I know it works with them It should be an easy problem to
sort.

>BTW, can someone give me an FTP address where I can get an up-to date newsgroup
>list and FTP site list.

Your newsgroup file should be up to date since oasis adds all new groups to the
ng file in the news folder. as for ftp sites check the ftp site list on the
atari web pages.. that is of course when you get cab up and running :-)

Hades/Medusa are NOT Falcon-compatible. They can't run special Falcon-software like
APEX and such. Hades/Medusa can't run games currently avaiable for STe/Falcon, because the
Medusa and Hades doesn't not have Falcon/STe compatible graphic-modes.

They run all GEM-kompatible programs, or programs that uses the VDI to display
their screen though.
You could say that Hades/Medusa are about as compatible as a TT with a graphics
card.

> As practically all "serious" programs run on Falcon well, there should be
> a healthy pile of nice software available for the PowerBirds, too.

Yes, indeed.

But don't forget the Hades/Medusa are not Falcon-compatible!

In response to articles:

It is my estimation that usage of the 600/660 versus the 540/560c will be pretty much the same. Price of cartridges are pretty much the same, although it still pays to REALLY shop around. Lowest price I've seen for a tricolor cart for 500 series is $27 at Price Club. A Tricolor cart for the 600 series is typically $30 at other places.

(I have recently come across a firm that claims to be selling refill kits for the 600 series at $55/kit. Black & tricolors included and claims about 6 to 8 refills per this kit. When the time comes I will try it out to see if this is the first of many to come, otherwise I may have been misled. We shall see.)

With regard to Pagestream, I recently bought a copy at TOAD's Holiday Fest. I cannot promise anything here, but I will take a look and see what may be possible.

I think EPSS is a great idea and I have the demo. It was a very good achievement on the STe/TT, and a Falcon version would be superb. Martin Griffiths' TDSM doesn't look like coming out for a while yet, but EPSS already more or less fills the same purpose. All it needs is 16-bit/DSP drivers to tap the huge potential offered by the Falcon.

Hello,

Is there anyone who has bought NVDI 4 or upgraded to NVDI 4 that knows if this new version has support for the HP DeskJet 850C? I was going to buy a HP LaserJet 5L, but if there do exist drivers fro the HP DeskJet 850C, I'll buy that one instead. The 850C is faster and is also capable of printing in colour.

Another question... which one of the DeskJet and LaserJet is cheapest when it comes to the price of "printed pages"? Any replies are very much appreciated!

On this note, is there a program that will just play a sample at startup
through the STE's DMA. So that it will play the sample and keep on
booting up!? Doesn't have to be a very high rate, 25Khz is plenty, (most
of my samples I've averaged down to 12.5Khz anyway to save space). I've
seen programs like this, but they either use the Yamaha chip, and it
sounds awful, or they wait until the sample has finished before they
quit. Anyone got any ideas?

Has the Medusa actually ever been sold in volume? I don't personally know of anyone that has one. It seems like these machines have only been in the prototype stage. The Hades sounds like it has the most potential of the two but they have to get them out in volume and past the prototype stage in order to be successful.

Incidently, why such nasty sounding code-names? When I think of Medusa, I don't think of "fast". Instead, I think of an ugly woman with snakes for hair who can turn me into stone.

Look again, it is there - but the file is of the PCL printer commands for the 500. There are no significant differences from the 500 to the 520. All the PCL commands you can manipulate are listed in the file named dj500pcl.exe (I think that's the name). You should find it buried within the pages for the printer perihperals.

Dunno about Neodesk or Dynacadd.
I never noticed the buzzing noise in Calamus SL, though.

My TT has TOS 3.05 with 20Mbytes of RAM (4 ST plus 16 TT)

Have you set the "Run from" and "Allocate" flags, or just one? Have you
tried turning one of the flags on/off? How were the flags when you bought
the software?

If the programs were pre-1991, you may have problems, as the TT wasn't
released until (very) late 1990. Try updating the software if they are
pre-TT.

For ST-RAM you can have 2, 4, or 10Mbytes which becomes 2+0, 2+2 or 2+8.
You do not "buy RAM" for ST RAM in the TT, you buy a memory board
populated with either 2 or eight megs.

There is a program called lps.ttp (lps=long play sample) which can play samples of various formats (au, wav, raw) directly from the hard drive with no processing delay, but not at a particularly high quality. It will run on any ST, so obviously it isn't leveraging the STe's DMA sound... still, though, it will play any sample of any duration from your hard disk. Not exactly what you were looking for but definitely better than nothing. I think it is in the atari archives (merit, umich) in the sound directory.

it?

LaTeX is a "macro-extension" of TeX and should be independent of the base TeX system. The site you are getting CS-TeX from should have all sorts of goodies including a number of implementations of LaTeX. Your biggest problem will be deciding which one to use! There are many other extensions if you are interested - for musical notation, chemistry texts etc. etc.

What about guitars such as the Epiphone semi-acoustics, which have some sort of 3-pin MIDI output (I believe it was a "Hi-Z" something or other). Even the standard phono-output, assuming a good setup, should generate clear enough tones for a simple conversion unit to generate the appropriate MIDI signals? If a tuner can pick up the notes, then turning it into something the ST can understand surely couldn't be that much more difficult? (And certainly a bit less than $1000... why on earth is MIDI stuff so horribly expensive!? Probably figure since the keyboards cost a fortune, the buyers have money to burn :)

Is such a thing possible without spending twice as much as the cost of my computer and guitar combined!?

: AT&F&C1&D2&K3&Q5&W
:
: Which will reset the modem and put it into standard mode with Error
: Correction/Data Compression and RTS/CTS flow control active. Then, just
etc...
```

I really do appreciate all the suggestions, but I really don't beleive it is anything to do with the modem settings. I followed the modem manual on this. I followed the STalker manual on this. What's more, RTS/CTS is obviously _working_ with my original set-up because I can download all files using z-modem without trouble. Certainly my computer is sending the transmitting computer flow-control when it starts choking.

Michael Olin was absolutely right. What's happening is STalker and HSMODEM have a very strange conflict when run together on a Falcon. This conflict only seems to affect _uploading_ via a transfer protocol that makes use of RTS/CTS. I don't know where the bug is, in HSMODEM or STalker (well, of course, if Atari had gotten the system software right in the first place I wouldn't be loosing all my hair over this). All I know is I need HSNODEM to make STiK work (maybe this can be fixed to run without HSMODEM?), but I can't run HSMODEM if I want to upload anything with STalker.

Actually, it ran fine on my VGA Falcon too, thankfully. It is quite
fast, even on my unaccelerated Falcon. The only flaw I find with its
current incarnation is it usually lets you poke a bit of the way through
walls and such before stopping you.

What is the next step in BadMood's evolutions? Do they pan to add texture
mapping? Will the implement the opposing characters? I would love to
see this eveolve into a full-fledged game!

Evidently you are unaware that It has been common knowledge in The Industry for years that Microsoft is Intel's secret weapon to get people away from cheap $2 CPUs onto expensive $300 CPU selling for $1000 each.

After all, would you rather use a nimble word processor that runs fast and lean on an AMD, Cyrix, Nexgen 486 CPU or M$ Word on a Pentium Pro (aka "P6"). If you were selling CPUs, you'd choose the latter.

Typically, ego ("bragging rights") comes before common sense ("What is the best tool to get the job done"), and when Joe Public goes to buy a computer, he will select an Anonymous 318/E24-Pro "With Pentium Pro Installed". M$ Word is bundled as part of the sweetner to buy this model from us instead of those heathens across the road selling exactly the same thing, so both companies get kickbacks.

And the PPro runs Word slower than the clone 486 with a wellmade word processor.

Sigh. And then they look down on us Atarians.

Double sigh...

Actually, it shouldn't be THAT hard.
I am a TI nut (yep, fits in fine with Atari!). A long while back, one of the prime companies in our little world went out of business. They had created a second-generation TI 9900-based machine that booted it's operating system from mass-storage, instead of being ROM-based like the 99/4A. So one of the other big guys in the community worked up an effort to buy out MDOS from this defunct company, and they sent around notices to the owners of this machine (the Geneve) to contribute towards the buyout. There are perhaps a thousand of us, but a lot of us chipped in $25-50, and we bought the operating system!

Seems if a handful of TIers can do it, a whole lot more Atarians (with more to look forward to, and only slightly more dedicated) could raise a lot of cash that Atari might not be able to resist. But it will take one of the big guys in the community, one of the major suppliers/developers, to be the focus, do the footwork, etc. Grassroots operations WORK, but they need a leader/spokesman/figurehead.

Speaking for myself, I wouldn't mind chipping in $25 or so, if it were a reputable Atari leader, on the calibre of a Toad Computers or some such...

>put 2 one meg in each machine in the first two slots? The memory configs
>I keep seeing listed go 1 meg, 2.5 and then 4 megs. Do I need to mix my
>simms and the original 250 K's together? Thanks.

To make a 2 MEG machine you just use 2 1 meg chips:

Back of machine
1MEG Chip
Leave Blank
1MEG Chip
Leave Blank
Front of machine

To make a 2.5 meg machine, you do the above, but put the 250k simms in the
blanks. To access the extra 0.5 megs you have to put a patch program in your
auto folder.

System Sulutions (ssolutions@cix.compulink.co.uk) do a range of NVDIs for
different screen cards, maybe this might help????

Vern you didn't mention what type of Atari computer you were
using, ST, TT, Falcon, also didn't mention how much memory you have, or
how many DPI you were trying to print at! As a guess from limited info.
If you have a 1 meg system, or a 2 meg system loaded down with auto
folder programs and accessories, then Pagestream will stop to
recalculate the rest of the page when it runs out of memory, then start
printing again!

OK... I'm looking for something Hard drive like to hook to a 1040stfm.
a bare icd board- adscsi, etc...
OR:
An older megafile, or similar external Atari HD, with a pooched drive
mechanism, but the adapter electronics still ok... I can come up with
whatever ancient MFM-whatever was in it....
(read below for swap, but I can pony up a bit'o $$ instead, if not
interested...)

I have.... (here come the random inquiries....)
something by ICD called an ADVANTAGE MICRO HOST ADAPTER. ICD sez it will
"allow you to easily install a 3.5" hard drive inside your Mega
computer". Comes with a power take off wire, a mount bracket, and a
little circuit board that clips onto the drive socket, and has a ribbon
cable that connects "to the DMA connector in the back left corner of the
computer" (inside the case).
(all quotes from manual)
There... that's ALL I know about it....
Want more info???? Call ICD. I don't have a Mega computer.
Also comes with manual and disk...

So..... you got some older ICD or whatever board to hook to the DMA
port,
OR:
one of those megafile external HD's, or similar with a seized drive
mechanism, and want to swap, drop a line....
Or If you have one of these for mucho cheap, and don't need a micro
whatever, drop a line too....

cheers...

: Sounds all too familiar... WE've been hearing this same tired line from
: Atari for the past 6 years.

: Can you say, "Same Shit, Different Day" ???

Well it WOULD make sense, think about it. Say that 100,000 Jaguar packs are
sold over Christmas, now say that in each case the buyers dont buy any
additional games till after Christams. It therefore follows that
they may buy more games over next year. This is simple human nature,
not many people can stand only having ONE games to play!!

Only if Ghostlink sees it as just another Hard Drive, technically speaking you should be able too, unless of course the data transfer rate from the cd rom is too fast for the serial port connection to keep up with... Ghostlink may handle this already though....a word of warning, if you are using this to install packages, make sure the executables are being run from a local drive as it isn't possible to execute a program over such a slow link, the system will time out and crash if you try it that way....

if the CDROM is SCSI you can get a SCSI box and switch it between your Falcon and your PC by plugging and external port into the place where your CDROM plugs into its card on the PC....if it's IDE you'll have to leave it where it is.

Quantum Fireball harddisks require Initiator Identification during the
select phase on the SCSI bus. ST host adapters can't do that, and the
TT/Falcon ROM TOS can'tr either, so you can't boot off these drives. On
TT7Falconm, you can access them when using a drives which can handle
Initiator ID (eg. HDDRIVER, CBHD 4.5).

This is a really good advice from a guy who doesn't talk perfect english but is using an Atari 1040ST since 9 years for making professional music and I'm really pleased by the system. It's never a failure to buy an Atari-Computer but your mother will never use it for that reason, you're talking about. It's more difficult to start up an system like this, and use it successfully than learning the sheet music notation itself, which is really not hard to learn. By the way, think about the problem, your mother will have to correct the results given by the computer, if she doesent understand the sheet music notation. I think it's more exiting for your mother to learn the sheet music notation than learning a complex structure of a complicate computersystem, and it's cheapest.
Best whishes Oliver Rafelsberger

] >I've heard that with 38400bps one can expect to lose a character every
] >at 38400bps, and that one needs to program a chip for the rsve. Which o
] >the most expensive, reliable, easiest,...?
]
] =============
] PART I - RSVE
] =============
] RSVE2 (the newer version of RSVE) is a very simple hardware modification
]
] A little GAL (grid array logic - a logic chip, which can be burned like
] a EPROM) "catches" the frequencies for 75, 110 and 150 bps and "translat
] them using a second oscillator so the MFP will run with 38400, 57600
] and 115k bps.
```

Where do you find a GAL though, (no jokes about night clubs please :),
and how exactly should it be programmed to cope with this?

The kit I saw advertised by the author of HS-Modem which was basically
the chip, and bits to hook it up, was something like $60US (I recall it
not being very cheap anyway). If someone could work out how to make
these at a reasonable price, they could certainly make a bit, I'd buy one
so I could use a decent speed modem on this thing....

If this RSVE-2 is a complete kit as is, then how much is it, and where
would I get it?

It is available on either Hensa or Atari-archive. If you want it, go get
it, although Gribnif would prefer ordering it from them so they can get
some money to cover the costs of newsletters and the upgrades themselves etc.

3179. PC-ST/ST-PC Disk FAQ

Newsgroup: comp.sys.atari.st
Date: 1995-12-06 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DJ6nAE.9uB@actrix.gen.nz>
Source record: 154959

I had nothing better to do for 5 minutes, so, here's a small FAQ which should about cover everything the average person doing it should need to know. It answers that "How do I read an ST disk on my PC" question....

The Basic FAQ of how to transfer data between ST and an MS-DOS PC.
v0.1 - Steve Wells

The simplest way to make a disk accessable by both the ST and the MS-DOS machine, is to format a 720Kb disk on the PC. This is done by taking a 720Kb disk, High-Density one and sticking tape over the HD-detect hole (which is the one without the sliding bit behind it), as many PC's refuse to format HD disks in 720Kb mode. Just use a disk you'd normally find on your ST, and you'll be fine (although, with PC's unfortunately becoming the "standard", 720Kb disks are getting harder to find).

Put the disk into the PC.

Type

FORMAT A: /F:720

This will format the disk to 9-sectors per track, 80-tracks (00-79), and 2-sides. Giving you near enough 720Kb.

This disk will now be readable on both PC's and ST's.

Or, you can format a disk on the ST. If you have at least TOS 1.4 installed, (later model Mega-ST's, and any machine from an STE upwards), then the computer will format disks to be PC-readable. Machines before this use a slightly different method which most PC's don't understand.

All you have to do for this, is put a blank disk in the drive, an select "Format Disk" from the "Desk" menu. Select "Double Sided" and "OK". Now wait. Not _all_ PC's will read disks formatted this way, the only way to find out if yours will is to try. Probably the simplest way is to track down "DC-Format" by Double Click software, which is available on most of the major Atari supporting FTP sites. The filename to look for should be DCFMT30.ARC. On atari.archive.umich.edu it's in atari/Utilities/Dc/ and on ftp.cnam.fr it's in pub/atari/Utilities/Dc/. It should be on most other archives in the utilities directory.

To format a PC disk with this program requires the settings to be:

Sides: 2
Format Type: Normal
# of Tracks: 80
Sectors Per Track: 9

Most PC's won't read disks with "Skewed" or "Twisted" sector formats, so don't format them with this option unless you know your machine will read them - the PC's I've tried this with work _slower_ with this format anyway, other than the ~50% increase obtained by using it on the ST.

Format the disk with these options, then select "MS-DOS Bootsector", and write a DOS compatible bootsector to the disk.

This way almost never fails. But those PC's are fussy machines, so it's usually best to use the first method and just format the disk on the PC it's going to be read by.

---------- Converting the data

You hardly need to touch most of it. GIF's are viewable by pretty much any viewer on the PC (CShow) and ST (Speed of lite). MOD Files aren't - there's about 10 different "standard" for MOD files now, and only a couple of them are usable on the ST. Scream-Tracker files, MED files, most Octalyser files and others, just aren't supported on the ST. Although, there are programs for the Falcon-030 that will play many of the new formats.

Text files are used by the same format. Just make sure you save your files out "As ASCII" or you'll have to work around conversion patterns. A well supported method is to save your files as .RTF (Richtext Format), which is loadable on most PC (Windows) word-processors, and a few on the ST. There are also convertors on the ST to change many PC formats into ones readble on the ST.

So, in a nutshell, the simplest way to transfer data using 3.5-inch diskettes, is to format it on the PC, and from there anything on it can be read by either machine. Plain ASCII text files are understood by both without conversion, and most everything else can be converted by a program at either end.

Note: If a disk already has data on it, and will not be read by the PC, then you CANNOT modify it to make it readable. You'll have to copy the data to a disk formatted using one of the above methods!

And that's it. Obviously it's not the tidiest, but the last FAQ I did for something ended up being 35Kb. Not something I want to repeat typing out unless absolutely necessary :)

^^^^^^^^^^^^^^^
Hmm, there's nothing in the current code that could stop you at all. ;-)

According to a letter on our mailing list today, the code for that has
been written now, though. As soon as the strikes in France ends, I'd expect
an updated BAD MOOD to be made available.

>What is the next step in BadMood's evolutions? Do they pan to add texture
>mapping? Will the implement the opposing characters? I would love to
>see this eveolve into a full-fledged game!

We do indeed intend to make a playable game out of BAD MOOD.
The more people that gets involved, the better the chances are of course.

Texture mapping is one of the next areas we hope to do something about.

3183. WWW115

Newsgroup: comp.sys.atari.st
Date: 1995-12-06 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <4a5j0r$18s@gti.gti.net>
Source record: 154963

I just tried out the new version of CAB that's released in WWW115,
and must say it's wonderful! Those who were mildly disappointed by
the earlier versions should be much happier. I looked, and it's already
on hensa, and probably waiting to be put in the newitems directory
of umich.

First off, execpt for the FIRST status message, all status messages are
now in a status bar on the top of the screen. Looks like you can still
use a dialogue box, but it looks much better in the new spot. There is also
a little bounching cursor to show activity.

Then there is a wonderful button bar. The buttons do all the same things
that the menus do, but having a button bar makes things easier to navigate.

And it also seems to be able to download and render at the same time,
tho in a somewhat limited way. I loaded a page of mine that is text
only, and started seeing text before it was finished.

Finally, there is a USA support address. Sorry to the folx across the
pond, but that's one of the things that often turn me off from registering
software that originates in Europe. Makes it so much easier...

Now if only someone would write a telnet app that hooks into STiK, the
world would be a much better place :-)

You're right. I find that starting Word 6 on a PPC is very slow for a
native application. Excel 5 is quick. Some rumours say that Microsoft has
set empty loops in the code for slowing the Mac version.
I recently received a message : someone installed Soft Windows on his PPC
and Word is quicker in Windows emulation than the Mac version. So it's not
the machine, it's really the version.

I've a Falcon and a PPC 7100. The Falcon has very good sound, the PPC too,
but Marathon II is great, and native applications are very quick (and
pretty). I had a TT and had to buy a Falcon for some jobs. And I find the
Falcon is slow, slow... TT was a really good machine.

Date: 1995-12-06 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <95340.095643STIRRE31@MAINE.MAINE.EDU>
Source record: 154969

I am selling my Falcon030. I am waiting to sell it after December
22, though, as I would like to wait until after my current semester
here at school.
Here is the info on the machine:
4 megs of RAM, 85 meg hard drive, TOS version 4.04. Unmodified
except for the internal speakers being disconnected. The only problem
that I have had with this machine is that the microphone port
sometimes does not work. I do not know why.
Here is what comes with the machine:
Hardware/accessories:
Koss SA/35 cheap external speakers (they do sound nice, though)
Golden Image Mouse (very nice mouse)
Jaguar Joypad
2400 baud Hayes modem
Software:
All of Atari's preloaded software such as AtariWorks and SpeedoGDOS
NVDI 3.01
Pagestream 2.2
Fleet Street Publisher 2
Marcel (registered)
STeno 1.04
STalker 2 (not the latest version)
Typesetter Elite
ST Word
Personal Pascal
1st Basic
Griff's DSP MPEG player (registered)
ST Data
ST Calc
Speed of Light (registered)
GFA Basic
Solutions
Street Fighter II
Elite II
Civilization
Asteroidia (registered)
Square Off! (registered)
Triple Yahoo (registered)
Super Bomberman (registered)
Winglord (registered)
Star Wars
Star Raiders
Pirates!
Gunship

Roadblasters
Space Quest
Police Quest II
Hoyle's Book of Games
Midi Maze
Moebius
Dungeon Master
Test Drive
Guild of Thieves
Impossible Mission II
Flight Simulator II
ST Format cover disks (maybe 10-20)
There is probably some things that I have forgotten as well. All software listed is bought and not pirated. I have manuals for most everything and original disks for everything.
As this system comes with quite a bit of goodies, I was looking for around $800. Again, I have had troubles with the microphone port so I do not promise this will work. If interested, please drop me an e-mail.

I'll just go and check but it's certainly as fast or faster than the
32 meg P90 I use at work! :)
> -What sort of speed does it play MPEGs at?

Pretty good I think but I have not tried this on the PC for
comparison.

> -Are there any good DTP programs available, and how fast are they?

Calamus SL - extremely powerful, very flexible, slightly sluggish
screen updates in 256 colours but very very fast print routines.
Also DA's Layout of which I have no experience.

> -Are there any good flight sims available that use the extra power of the
> Falcon, or are there only ST flight sims?

Only ST as far as I have heard.
>Also, I have heard various alternative desktops mentioned, Ease particularly,
>but have seen no screenshots or details anywhere.

The standard Falcon desktop is actually very good. Neodesk is also
good but different, Ease looks good and running with Magic 4.0 and
Kobold for file operations should be stunning. There are a couple of
new desktop / operating systems about to appear and the choice of 3 (I
think) at the moment Unix...ish clones.
>
>Finally, are there any Mac emulators for the Falcon?

In development I believe.
>
Any general thoughts on the performance and quality of the Falcon would
>also be appreciated. I have a choice to make, buy a Falcon or a Mac....

If your main purpose is hard disk audio (me too) then you will have to
buy an AV Macintosh to gain a similiar functionality to a Falcon
running Cubase Audio. The high end PowerMac AV's in fact have two DSP

chips and so can manage twice the number of tracks that the Falcon can. They also cost several thousand pounds more!

Anyone who sees my Falcon / Cubase Audio system in action is bowled over by the quality, flexability and sheer ease of use. It has also proven to be infinitly more reliable than many Macintosh / Pro Tools systems that I have heard of.

Best Regards

Eddie McGlone

P.S. I just checked the Jpeg thing - seems to be about 20 seconds if you are already running in 65k colours.
35 seconds if you double click on the Jpeg file using the public domain Apex viewer - this includes loading the file, changing resolution from whatever you were running into 65k colours scaling the image to fit whatever screen you are running and displaying the image.

DNS
>
mean?)
<g>>

It's in the stik.cfg file I think (failing that, DIAL.SCR). Ask Demon what
DNS to use, they'll tell you what's best for access via
them.

DNS is "Dynamic Name Server", it converts names like src.doc.ic.ac.uk into
the actual tcp address (various numbers). Just makes it easier to get
around. There's probably more to it, but that's what you need to
know.

> Yep... Demon automatically generates a newsgroup list every night, so

From: szhays@bullwinkle.ucdavis.edu
Message-ID: <4a4mrf$24f@mark.ucdavis.edu>
Source record: 154975

Wow, the new STiK/Cab package (WWW115.ZIP) is a great update! Forms, tables, wallpaper, etc... Plus it seems a little more solid, less crashing. Seems to be faster also, but that just might be my enthusiasm. Who knows. Simple upgrade installation. Hotlist now saved as an NTML file (but automatically converted my old Hotlist without my having to bat an eye). A button bar has been added across the top of the window with back, reload, and everything else you might want.

I miss the more understandable cache system of the past several releases, but I suspect this new system will not suffer some of the interesting quirks the old one suffered (e.g. if a URL began with the same 8 characters and ended with the same 3 characters as an earlier URL, CAB would assume they were the same and load the page from the cache, even though it was the wrong page, and without the reload button that was annoying.). Also, the color dithering process seems to have changed a bit.

One interesting thing is the YAC Page's wallpaper, which is beautiful and unobtrusive under Netscape, even in 16 color mode, is totally illegible under the new CAB, unless you turn off "take background color from server" (or whatever that option is called). Expect a new CAB friendlier update to the YAC Pages ASAP.

Yac Pages: http://dcn.davis.ca.us/~dmlarson/yac/

G.J. Ayre (u3gja@csc.liv.ac.uk) wrote:
: Hi, I'm considering changing my Archimedes for a Falcon so that I can do direct
: to disk recording. Obviously the Falcon will not compete with my 36 Mhz RISC
: based Arc on processing terms, but I understand that the extra chips (Blitter,
: DSP etc), also affect performance. I was wondering if anyone could give me some
: idea of how useable the Falcon is in the following areas:
:
: -How long does it take to decode a 640x480 JPEG file?

My Falcon runs 50 MHz DSP and 40 MHz CPU, which gives, using Apex Media
True Color picture viewers, the following figures:

- a 500 kB GIF: 3 seconds (loadind and displaying together)
- JPG: about 7 seconds

: -What sort of speed does it play MPEGs at?

I've got 10..19 FPS in high-colour mode (MPEG_DSP program)

: -Are there any good DTP programs available, and how fast are they?

Calamus SL is said to be the best there is, on any platform. Anyway, it's
excellent - and quite usable on Falcon, especially on accelerated Falcons.

: -Are there any good flight sims available that use the extra power of the
: Falcon, or are there only ST flight sims?

Sadly, though there are some Falcon-specific games available both commercially
and non-commercially, the best flight-sims are the older ST-ones. Especially
F-19 works very well, though. Most ST-games require an utility program called
"Backwards" (shareware) in order to get them running.

: Also, I have heard various alternative desktops mentioned, Ease particularly,
: but have seen no screenshots or details anywhere. Can anyone give me any info on
: this (or other GUIs). Some screen grabs converted to GIFs or JPEGs and e-mailed
: would be helpful if anyone has the facility to do this.

I like Thing 1.0 VERY much ;-) ! It's simply wonderful. And shareware!
I don't have a picture here where I write this message, but perhaps later..

: Finally, are there any Mac emulators for the Falcon? If so, roughly how much do
: they cost, and what functionality do they give (will they support 256 colours,
: what sort of speed? Does a Falcon get anywhere near the speed of a Mac LC11
: under emulation? They have the same processor I believe.).

Things with Mac-emulation aren't too well right now. Dave Small is said to
write a new version of his famous Spectre GCR; perhaps that would fulfill
your needs. Somehow I doubt the whole idea of emulating things...

: Anyway, thanks in advance to anyone who replies (either on this group or
: e-mail). Any general thoughts on the performance and quality of the Falcon would
: also be appreciated. I have a choice to make, buy a Falcon or a Mac....

I use Mac Quadra right now - as almost every day. But to be honest, I would never change my Falcon to Mac... I used to think that Macs were the greatest computers under the sun. But using them this much has revealed things I simply cannot stand. Computer itself may be fine, but the OS - it's rubbish =(... You will hear some people yell how terribly wrong I am, but that's life - especially life with computers ;-) ! One of us loves the daughter, some her mother. Many tastes, many personal choices to make..

: Cheers,

Cheers & lots of beer!

: Graham (u3gja@csc.liv.ac.uk)

Come on get real, Calamus is one program that will run on virtually
any atari set up (RAM and HDD space allowing), as long as the rez is
high enough then it can run on virtually any TOS version, and set up.
Try picking a few apps, that are complete b*stards to run on anything
other than a stock ST, and THEN start saying what the new atari-clones
will run !!!!

An odd way of doing it. I suppose its quite a subtle way, my own
choice would be to simply not produce software for the platform at
all. Saves a lot of bother. And of course all those MAC users who
try MS word who've never used a PC, will not even know its slow....
>

Probably due to the OS, I'm not sure about the size of the MAC System
7, but I'd guess its a bit bigger than the falcons, just look at what
the size of windows on the PC can do to cripple a computer !
>
>: Don't get me wrong; Ataris are cool, but Macs are the next best thing.

Unfortuanately unless a hoem-computer priced replacement for my ST
pops up soon, I may be forced to buy a MAC as my next computer :(.

Does anyone know the mathmaticla process a calculator, or computer goes through to find the square root of a number. I'm interested because I fancy writing my own routine, and hope to be able to get more acurate results (using fixed point values, from the shifted floats).

Any suggestions to my email address (prefered) or to this group. my email ad, just incase you don't fancy reading the header:

phil4@phil4.demon.co.uk

Thanks

Aha, but you have access to all the latest games via the net... so have the
ability to be selective in what you choose to get. By the time you get the ST
Format disk you will probably already have most of the stuff on it, and probably
better versions of the programs as well!

I havn't even taken the wrappers of the last 5 months worth of disks! ;)

I think Atari has (had) a good knowhow about developping good powerful
hardware as the jaguar surely is. But i don't think that they really have
the force to go into such a stong market. Nintendo, Sega and Sony have done
much more in advertising, have built game-helpdesks, have the possibility to
get sequences from latest movies to use them into the games. (I heard about an
interactive game with Silvester Stallone). Well, i might be wrong, i'm not
interested in games and don't use them at all so therfore not that well informed.

It would be probably easier for them to go back into the computer market, but
even that is not possible anymore. Who would trust Atari as company anymore?
Even if they put now a powerful machine on the market, with a "refreshed" OS
i would not buy it, the risk to be one year later in the same situation as
now is to big.

OFFICIAL MERLIN PRESS RELEASE

As from 9.00 am on the 5th December, Merlin owns the copyright to
Unique Development Sweden's Obsession for the Atari Range of computers,
exactly one year on since its release.

Merlin will be able to provide time to further develop the Falcon
version and release new tables. Therefore Merlin would like to announce
two new flagship products :

Obsession Falcon 1 : 256 colour version of the current Obsession

Obsession Falcon 2 : A new re-write of the game including
Multi- ball and extra flippers, redesigned 256
colour tables.

These will hopefully be avaiable by Mid-March

Merlin is also exploring the possibility of the releasing new tables
for the existing Obsession and are awaiting response from current
owners.

Unfortunately, the much publicised Black Box will now no longer be
available after Christmas.

For further information, please do not hesitate
to phone or fax us MERLIN on 01452 770133
or writing to PO Box 77, Stroud, Glos, GL6 9YD
or E-mail us on a.pope@auntie.bbcnc.co.uk

This is an internal ACSI/SCSI hostadaptor for a Mega. You connect a
SCSI drive to it, and it uses an internal DMA port in the Mega.
You could also use the standard DMA port of a non-Mega ST if you make
a cable.

: readable on a PC, but by using an MSDOS compatible formatter it worked
: just fine!

Arrrgh - so your PC probably even checks for the "IBM" string in the
bootsector or for the Intel JMP instruction at the beginning of the
bootsector! Usually, it should be enough to fix the mediabyte (if you
have a TOS 1.0/1.02-formatted disk).

:(I used "Hcopy 1.6" which I believe you Claus has
: participated in designing!- Is it still supported?)

Hcopy is loosely based on predecessor code which was part of
my book "Scheibenkleister". I don't know the current status of
Hcopy.

TC>support bus arbitration, the drive never gets permission to use the bus and
TC>you can never use such a drive for boot purposes.

You don't need bus arbitration for the fireball to work - initiator
identification is sufficient, ie. the computer must identify itself using
its own ID during the selection phase on the bus. Bus aerbitration
includes initiator ID.

TC>However, with the right hard disk driver you can use the Fireball AFTER you
TC>use another SCSI device to boot with. The jist here is that once you have
TC>a "bus arbitration aware" driver loaded, you can use the Fireball...but the
TC>only way to load that driver is via floppy or a SCSI device that does not
TC>do aribitration (i.e., most SCSI-I or SCSI-II devices).

This works only if you have a TT or Falcon, where the driver may program
the SCSI controller. Standard ST hostadapters do everything themselves,
so the driver can't change their behaviour.

TC>As history, bus arbitration has been in the SCSI specifications for some
TC>time (maybe even since the beginning), but nobody has implemented it until
TC>now, and even still the Quantum Fireball is the only SCSI-3 device that I
TC>have heard of that does it.

There is no such thing as SCSI-3 currently, and the fireball definitely
is a SCSI-2 device.

3222. Panza Kickboxing on Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-12-06 00:00:00 UTC
From: allfree@scs.unr.edu
Message-ID: <4a33rk$nq5@silver.scs.unr.edu>
Source record: 155036

Has anyone gotten Panza Kickboxing to work on the Falcon? I've tried Backward, and whatever else, but it doesn't seem to. Also, what does anyone think of my chances of asking the company for an unprotected copy so I can stick it on my HDD? Thanks for any help :)

Ben Allfree

Ghostscript 3.51 will display PDF files. I think the current Atari
version is 3.33, but that can display PDF files too.

Hi,

this is posted for a friend.
He needs to convert images from the Atari .PAC format into
PC formats .BMP or .PCX

Does anyone know of programs doing that on an Atari or on the PC ?

Thanks,

Franz

Well, as I;ve heard it told, GBS had problems with some vendor
supplied components that led to their being unable to ship their
product. They sued the vendor, but unfortunately lost the lawsuit. So,
GBS is out of business and won't be back. Dave Small posted a message a
few months back that said he was still working on getting System 7 to
run. But, don't hold your breath!

3228. HP LaserJet 5L - First Impression!

Newsgroup: comp.sys.atari.st
Date: 1995-12-06 00:00:00 UTC
From: dhedberg@zen.kuai.se
Message-ID: <4a4gq1$gcr@bundy.mdk.se>
Source record: 155042

Hello,

I have now bought the HP LaserJet 5L printer, and tested it quickly on my
Atari Falcon030. Here's my first impression...

* Ugly, yes I really think it's ugly, some will probably say it looks
great, but I prefer the old standard Laser printer look. There is one
big advantage and disadvantage of the new design.

Advantage: The printer doesn't take up much space at all on the desk.
Disadvantage: The papers are placed vertically from the top, so they
are not covered from dust etc.

* Quite, it's dead quite... almost. But you can't really hear it's on and
it isn't producing much noise when printing either.

* 600dpi, I didn't have no trouble at all getting it to print in full
resolution using NVDI. It was pretty easy to modify the driver.
I also recommend the HP LaserJet 4 CPX for configuration the printer
hardware. It works excellent on the 5L as well.
Anyone interested in the driver modifications or the HP LaserJet 4/5
Configuration CPX, please E-Mail me and I will help you out!

* Fast, the printer is fast. The printing speed is 4 pages/minute, and there
is no delay for the first page, it's printed in maximum 20 seconds.
It's also extremely quick in the "warming up" process, takes no time
at all.

That's my first impression of the HP LaserJet 5L, if you have further
questions, please e-mail me and I will try to answer them!

3230. HP 600 or 660?

Newsgroup: comp.sys.atari.st
Date: 1995-12-06 00:00:00 UTC
From: thietavu@news.abo.fi
Message-ID: <4a4j8d$k43@josie.abo.fi>
Source record: 155044

Can anyone recommend either HP DeskJet 600 or 660 - will they do exactly
the same job when 600 is equipped with color kit?

Btw, I wonder: does DeskJet 660 use BOTH its ink cartridges when e.g.
printing a page containing both black text and color graphics? Or will
it only use the color cartridge then?

Any help appreciated (can't decide which one to buy ;-) !

Greetings,
Tommi

>where or do I need an ATARI specific disk drive, special chip or cable?
I think, any DD-disk-drive with Shugart-Bus should do it. Only the front
of other floppy-drives doesn't look like Atari-Floppy-drives, so you
might have to manipulate your computer-case.

You only have to check the Power-Plug. The new disk-drive should have the
same connections with +5V a.s.o.

I have bought a NEC FD 1037A some years ago as a 2nd floppy drive, this
one only needs +5V.

> Do dips need to be set, the room rearranged or sacrifices made? I know less
>than nothing about this and would appreciate any help that anyone could lend.
Dips: No, if it is set to the original Atari-Plug.

I think the first error (the "listening" one) is probably the cause of
all the rest. Did you set up those weird-looking links with /dev/pipe
in them in your mint.cnf file? Most problems with the TAF distribution
seem to stem from not following the instructions to the letter.

BTW the Kfree/Kmalloc error seems to be due to a bug in the version of
sh supplied by TAF. Once you have everything working, consider looking
around for a better sh.

Source record: 154904

The new program certainly looks good. However, it's been more a tale of repeated crashes than resounding success so far. I've managed to get the occasional site loaded properly, but more often than not I get the message "TOS Error -69" (running under MagiC). Anyone got any clues?

BTW, whilst testing I tried to get into the Dillons Bookstore home page at http://www.dillons.co.uk/, and after multiple re-loads afetr crashes and getting apparently quite a good way in, I kept getting the above message, always at 8738 bytes loaded - on 6 successive attempts!

I have had other crashes, but this seems the most common. Maybe a non-MagiC set-up will do better...must go and try...

Andrew

Not according to Quantum. They definitly advertise the Fireball and other
drives as SCSI-3. Check out http://www.quantum.com for more detials.

>it only use the color cartridge then?
>
>Any help appreciated (can't decide which one to buy ;-) !
>
>Greetings,
>Tommi

With a 600, you have to remove the tricolor cartridge and install the
black, when you want to print real black (for letters and stuff).

When using the tricolor cartridge, "black" is made by mixing the colors
(printer does this). Unfortunately, it is not a true black - therefore
your colors may not be as 'correct' as they should be.

Primarily, it can become a nuisance when you want to mix text and
graphics on a sheet of paper. You would have to feed the sheet back in,
to print the other (text then picture, or picture then text) after
switching the cartridge.

Since the prices are near enough, I would recommend the 660C for the
convenience of having true CYMK (color & black) printing in one pass.
This means the firmware logic is NOT exactly the same between the 600 &
660, the 660 does automatically "switch" the use of cartridges depending
on the commands it gets. This way it is taken care of for you.

The added benefit of either one of these printers is that they now
support nearly all weights and most paper sizes (letter, legla, A4, A5,
envelopes - single slot and a handful at a time,...)

Message-ID: <4a7q1s$7ito@hopper.acs.ryerson.ca>
Source record: 154909

```
Atari Stuff For Sale
--------------------
I'm clearing out my second Atari Mega system with programming and animation
software, and books. Priced to move, as they say!

Hardware:
--------
Atari 68000 Mega ST4 computer with cables, manuals, keyboard, mouse, in orginal
packing. 1Meg memory. $50

Atari SC1224 colour video monitor $30
(With computer, $20)

Practical Solutions Videokey: RGB to composite (and rf modulator) in original
box, with manual, almost unused. $10

Migraph Touch-Up hand scanner with documentation and original disks, works
fine, not used much. $50

Software, all with original disks and manuals:
----------------------------------------------
Cyber Studio CAD 3D V2.0 $15
Cyber Paint $10
Cyber Texture $10
GFA Basic Compiler $5
3D Developer's Disc for CAD 3D $5
Aegis Animator $10
Intersect Software: Revolver $5
(a task switcher)
Generic First CADD $5

Books:
-----
Compute's Technical Reference Guides
Vol I: TOS (The Operating System) $5
Vol II: AES (Application Environment Services) $5
Vol III: VDI (Virtual Device Interface) $5
Atari ST, Tricks and Tips, Abacus $5
Atari ST, GEM Programmer's Reference, Abacus $5
Atari ST, Internals, the inside guide, Abacus $5
Presenting the Atari ST, Abacus $2
ST Disk Drives, Inside and Out, Abacus $5
GFA Basic Book, Michtron $5
GFA Basic: Concepts in Programming, Michtron $5
GFA Basic Manual $2
C-manship Complete, Clayton Walnum $5
```

Programmer's Guide to GEM, Balma and Fitler, Sybex $5
Atari Documentation, Four Binders Free

I can be reached at 416-465-3007.
Prefer to sell in Toronto area, otherwise we'll have to arrange shipping.

Cheers -
Peter

> >Hi there!
> >
> Has the Medusa actually ever been sold in volume?

Quite a number has been sold in Germany, and the Medusa T40 is NOT in a prototype stage. It has been avaiable for about a year now. You should be able to get it at Lexicor in the U.S. too.

> I don't personally know
> of anyone that has one. It seems like these machines have only been in the
> prototype stage. The Hades sounds like it has the most potential of the two
> but they have to get them out in volume and past the prototype stage in
> order to be successful.

Medusa T40, T60 and Hades are all ready, not prototypes.

> Incidently, why such nasty sounding code-names?

Nasty sounding - I think names like Medusa and Hades gives a curtain "kick-*ss" atmosphere around these machines.

> When I think of Medusa,
> I don't think of "fast". Instead, I think of an ugly woman with snakes for
> hair who can turn me into stone.

Yes, that's right - You DO get stoned when you see how fast Atari programs run on a 68040 machine like the Medusa.

3258. Need help dumping Emacs 18.57

Newsgroup: comp.sys.atari.st
Date: 1995-12-07 00:00:00 UTC
From: chambera@cs.pdx.edu
Message-ID: <4a84ip$98b@sirius.cs.pdx.edu>
Source record: 154922

Arrrg! Can somebody give me a hand dumping Emacs from the 18.57 distribution (I got it off Hensa, it seems to be the latest).

I've set up my environment variables EMACSLOADPATH, EMACSLIB, EMACSDOC, and UNIXMODE as the README file indicates. When I try to run DUMPEMAC.TTP I get the message saying how long it will take, then two bombs and it goes back to the desktop. I've tried running it from Gulam with the same results. Also, turning off all ACCs and AUTO folder prog's does nothing.

I'm running a 4 meg 1040ST with TOS 2.06 and an ICD 16MHz accelerator.

Any and all advice appreciated.

Thanks,
Alex Chamberlain

>>
>>ii) Atari are soon going to stop making Jaguars and concentrate on
>>making PC software.

Here goes:

i) Atari and virtuality have parted company on the headset project. Atari are going it alone, but it WILL be available.

ii) Atari are going into the PC games market, because there is a lot of money to be made. It is a financial move, designed to provide atari with cash. It is NOT pulling out of the Jag market. I think that if it did it would be the end of the road for Atari, and I think they think that too. Atari are staying in the console market, because of the vast amount of money to be made. They would be stupid to move out of it anyway, after they have fought so hard to get to their current market position. Another thing to note is that the Jag is a lot more popular in america than it is here in Britain. Atari have been concentrating on that market in the same way as Japanese manufacturers concentrate on the Japanese market (though not to the same extent. We do not see jap machines for a year or two before they are released here, whereas Atari has released the Jag after not much delay here). There will be a spread of strength for the jag from accross the atlantic. The Jag is with us for as long as Atari is here with us.

I heard the virtuality bit, and Ataris position on pc software development from an official source on WWW.

>NeST...

I may well return if i don't improve my newsgroup download speed. I have a suspition that it is slower than it should be... but can't be sure. If only the internet used compressed packets like on fido!!! :((

I am only connected to a few news areas... and it takes about 12 minutes a day at the moment to collect 230 messages. Is that about right? :|
(3 seconds per message).

>I haven't really had a look at Oasis... And I can't get anywhere with NOS
>either which I think is a
>nightmare.

Oasis is certainly a very good program.... I wish I could get it to work under MagiC, but it doesn't for some reason. When I call NOS from Oasis it isn't loaded :(

>It's in the stik.cfg file I think (failing that, DIAL.SCR). Ask Demon what
>DNS to use, they'll tell you what's best for access via
>them.

I have now got CAB/STIK working fine... what an excelent program it is! For some reason I have to enter my POP address in the <stick><other><IP Address> box every time I want to use it though. Also, when I boot up it says "Client_IP bad format", but I can't see that I have done anything wrong :|

>I presume you've got the list of Atari ftp sites that's available by
>now?

Yep thanks :)

>What's the ravanol for
>BTW?

It's something I made up years ago :) BTW, when I said I was connected to a few areas i meant.... 3 Atari areas, sci.space.news, and alt.music.nin! NIN being by far the biggest.... they are all total Trent worshippers! <bg>

Sometimes when I join an IRC channel, it displays who is in there as usual, but I don't see any messages scroll up on the screen. It is as if the people are just sitting there and not doing anything. Is this normal? I wondered if maybe the people have left the area, and the IRC program hasn't cleared their names from the list?

3264. Printing in Atari Works

Newsgroup: comp.sys.atari.st
Date: 1995-12-07 00:00:00 UTC
From: dhedberg@yin.kuai.se
Message-ID: <4a5dlo$903@bundy.mdk.se>
Source record: 154997

Hello,

I have problem printing in Atari Works. I am using NVDI v3.02 for
SpeedoGDOS printing.

The problem is that the first line of text is cut off on the half, it
doesn't matter if I change the TOP MARGIN in Atari Works (Page Setup),
actually it doesn't seems to give any effect at all. I have modified the
printer driver for my LaserJet 5L, the maximum paper size (writeable area)
and the physical margins. I have also tried to make the writeable area even
smaller but no effect. Is there anyone able to help me out on this one?

The left and right border marghins in Atari Works do give effect, though.
But the upper and lower ... nope!

The printer works perfectly well with all other software tested!

2 x 2Mb SIMMs in each should do the trick.

In additon to this you should be able to put 2 x 256K SIMMs in the other 2 slots give you 2.5Mb in each machine. For this you will need to load a patch file or else the STEs won't pick up the last .5Mb. This is calld 'SIMMFIX' or similar. I don't have a STE at the minute so I can't really be any more precise.

My STM has 2.5Mb (in DIL chips) though - so I know that 2.5Mb is quite a usful amount to have.

:-)

The Jag's been out for what two years now, and there barely any decent games for it. Between the lazy game programers, the biased media who still remember that stupid thing with the 2600(that was over 10 years ago folks) and the way the Tramiels run the business(I loved how they "drop" the ST's to support the Jag only to have the stock tumble the next day); is it any wonder why the Jag is not doing so well? The empty promises over the years don't exactly help either.

> Well it WOULD make sense, think about it. Say that 100,000 Jaguar packs are
> sold over Christmas, now say that in each case the buyers dont buy any
> additional games till after Christams. It therefore follows that
> they may buy more games over next year. This is simple human nature,
> not many people can stand only having ONE games to play!!

But what if the games are not as good as, say the ones from the 8-bit NES? Jeff Minter can't continue to carry the Jag on his games alone. The designers should put alot more effort in design excellent games for the Jag, I mean we should see lots of texture-mapping that the other guys have. And maybe if Atari Corp would stop treating their programmers like garbage, we can see some real output here.

As it stands for me, the Jag is only worth getting for the stuff Minter wrote. :)

Roland makes a controller/pickup combination but rather costly
(on top of the cost of the computer & sequencing/printing software)
and i cant say it would work on an acoustic guitar...

>This sounds like a wonderful idea, but I need to answer a few
>questions before I can go ahead with it. Can you help me with any of

>1) Does the Atari have software available that can translate MIDI to
>sheet music?

Some commercial sequencers have printing (scoring) features.

>2) Does the ST have the hardware necessary to interpret guitar sounds
>and turn them into sensible notes?

No.. the pickup/controller combination is what converts sound into
MIDI... The sequencer keeps track of these notes in relation to
time...

: Wow, do you *really* mean I can run DOOM on my old ST, how much memory does
: it need?

Err... Currently it can used for walking through WADs... It doesn't
have texture mapping. On inquiering about it from Johan Klockars,
he replied that it might well get 1/2 fps on with a small screen size
(say 1/4 of ST low). I understood that none of the developers has
tested it on plain ST (I can't myself as I got monochrome monitor
and Mood doesn't (yet <g>) work with mono), so if you'll test it
yourself, let us know about your experiences!

> idea of how useable the Falcon is in the following areas:
>
> -How long does it take to decode a 640x480 JPEG file?

On my standard Falcon a 100 K JPEG is quicker than my brothers 486 DX-50.
But for a 640x480 it will load in 5/6 seconds.
If you have a specific JPEG I can test it for you ...

> -What sort of speed does it play MPEGs at?

The standard 'Black or White' clip from Michael Jackson will run at 17 fps in
mono and around 11.5 fps in colour.

> -Are there any good DTP programs available, and how fast are they?

> -Are there any good flight sims available that use the extra power of the
> Falcon, or are there only ST flight sims?
Only Steel Talons. But there was a Czech? (Polish ??) one reviewed a few months
ago in Atari World which looked very nice.
Most ST FLight Sims should work. Knights of the Sky apparently is very nippy
...

I am going to the B'ham and London Atari World shows this weekend where I should
be able to test the new COMPO Accelerator. Its a 64 Mhz 68040 with upto 128 Mb
Fast RAM.
It should be demoing software etc. including Apex Media.

The performance for CPU functions should be *very* fast - but I'm not sure how
well software that relies just on the DSP will improve. (Or fall over :-0)

There maybe a new set of Apex Viewer utils to work with Falcon accelerators.

I'll also take Bad Mood v1.32 alpha to see what 'fps' rating it comes out with
(if it works!)

Regards,
Simon

>printing a page containing both black text and color graphics? Or will
>it only use the color cartridge then?

>Any help appreciated (can't decide which one to buy ;-) !

The 600 uses Black OR CMY colour. It only has a single cartridge slot
so colour output is not quite as good as the 660 which has both
cartridges resident.

I have a 600 for use on my Mac, the output in colour is VERY
impressive in 300x300 DPI, but the 660 is a bit better since the
blacks in an image are actually black.

Hope this helps...

I run a 4 meg 520 STE using:
Pagestream 2.2, LDW 1.1, Flash 1.6, WW 1.0

What are the software impacts for me from a move to:

Falcon, TT, MagicMac, Gemulator?

thanks, bk

Actually this can be achieved with Oasis/NOS!
I log in at my provider with STIK and then I have access to
PING, FTP and TELNET with NOS.
I had to write a tiny piece of code though...

Source record: 155070

>The simplest way to make a disk accessable by both the ST and the MS-DOS
>machine, is to format a 720Kb disk on the PC. This is done by taking a
>720Kb disk, High-Density one and sticking tape over the HD-detect hole
>(which is the one without the sliding bit behind it), as many PC's refuse
>to format HD disks in 720Kb mode.

You should NEVER do this!!! as the magnetic coating is different from
a DD disk. You *might* risk losing data this way.
(I'm not just saying this- I've heard it from several sources)
Use a DD disk for 720K and a HD disk for 1.44MB like they're designed
for and you'll be safe (most of the time anyway)

>Or, you can format a disk on the ST. If you have at least TOS 1.4
>installed, (later model Mega-ST's, and any machine from an STE upwards),
>then the computer will format disks to be PC-readable. Machines before
>this use a slightly different method which most PC's don't understand.

Well, I have an STe, and it didn't work with either the "old" 1.62
version of TOS or the new 2.06 I have in it now. Your best bet is to
use a formatter program that specifically formats MSDOS.
(I find "Hcopy 1.6" to be a great program for this- it also formats a
LOT faster than Atari's attempt of a formatter).

>Most PC's won't read disks with "Skewed" or "Twisted" sector formats, so
>don't format them with this option unless you know your machine will read
>them - the PC's I've tried this with work _slower_ with this format
>anyway, other than the ~50% increase obtained by using it on the ST.

Modern copy programs usually have a "format MSDOS" option (or format
MSDOS anyway by default) so you don't have to worry about this when
you use them.

>But those PC's are fussy machines, so it's
>usually best to use the first method and just format the disk on the PC
>it's going to be read by.

But I know for a fact that many PCs format the disks with the same
serial number, and as far as I know this can mess up things with an ST
as it confuses disks somehow. This also applies to pre-formatted disks
that seem to be very common these days.

You can check the serial number using a program called "serial.tos".
This way you can also check if the Atari formatter makes random serial
numbers for your disks.
You can also use "uneekit.tos" to change the serial number to a random
one.

> ----------- Converting the data
>Text files are used by the same format.
[...snip]

One thing to keep in mind is that with other systems than MSDOS
machines that understand the MSDOS *disk format* there are different
ways of saving ASCII text. On Ataris and PCs you have the usual
CR/LF end-of-line characters.

But on Unix systems you just have an LF ending and on Macs you have CR
endings. This pretty much messes up your screen if you double click a
text file from the desktop and try to read it.
You can manually add CR characters by pressing the <return> key to
advance instead of the space bar (CR= "Carriage Return"= Return!).

You can also read the text file within a text editor and resave it, or
run it through a converter program like "unix2st.ttp" which will add
CR to the LF end-of-line characters. All of this is for Unix type
ASCII text files- I haven't tried Apple Macintosh made text files yet-
maybe someone else can explain how this looks like and how to remedy
the situation?

(to convert ASCII text files that have been written on an ST (or PC)
you can run "st2unix.ttp" which will naturally remove the CR
end-of-line characters and leave you with the LF standard as in Unix.

>Note: If a disk already has data on it, and will not be read by the PC,
>then you CANNOT modify it to make it readable. You'll have to copy the
>data to a disk formatted using one of the above methods!

Not true! You can "convert" the bootsector of any normally formatted
ST disks (not extended formats etc.) using programs such as
"convert.prg" (I think there are a couple more similar programs as
well for this).

You simply run this program and it re-writes part of the bootsector
without the need of reformatting the disk. I've done it with several
disks and had no problems, but for important data I'd suggest you make
a backup first (in that case you might as well just do a real MSDOS
format anyway, and copy the data to the new disk).

I've been asked to help produce a title sequence for a sci-fi movie.

I want to do it, so what do I need and how much will it cost. I want to capture some of the jaguar output to video, combine it with animation from Apex media, and add some real footage.

I seem to recall someone produced a specialist unit to do this.

I'm a falcon owner/usr but will also be using a power mac as some of this stuff is going to be done at work.

Please email me about it and I will post a summery.

Yes, you can do what you're thinking about. All you have to do is get a MIDI adapter that fits the sound hole, and will translate to digital. For the program, get Cubase. It will create notation as fast as she can play...believe me, I play classical piano, and have literally watched my original scores speed upon the screen.....I just wish, it would PRINT as fast <G>

SS> 4 megs. Do I need to mix my simms and the original 250 K's together?

Hi Steven,
You plug the two 1MB SIMM's into slot 2 and 4 if looking from the front of the computer. Don't struggle with the left-overs, I've heard that there is some program available that is capable of activating the extra 512kB, but some programs have a hard time functioning with a 2.5MB configuration. It's enough with 2MB in many cases and if not - go for 4MB instead, to be certain of the functionality.

: impressive in 300x300 DPI, but the 660 is a bit better since the
: blacks in an image are actually black.
:
: Hope this helps...

Thanks, it does! Does 660 use both of its resident cartridges at the
same time? I mean, when you print something from a DTP program, does
the 660 automatically use its black cartridge for black text, and then
change to color cartridwe when needed? This would mean better black
quality, since (as I understand it) every time one uses color in his
documents, 600 has to create black color by printing all the colors
on top of each other, thus creating something not quite black, and
probably not very sharp either. Do I always get bad quality black
printing when I use color in my documents? How smart HP 660 is in
this area - can it save color ink and print black and gray tones
with one cartridge, while at the same time printing in color..?

Thanks, if you still can find out this ;-) ...

I think it's a rather interesting question, after all.

No the Arc is a fast machine indeed. Is it one of those new RiscPC's or is it a
big Archimedes ?

> but I understand that the extra chips (Blitter, DSP etc),

Well, the BLiTTER is only useful for games mostly, doesn't really at desktop work.

The DSP on the other hand has a lot of potential, it's also a RISC-based processor.
And it's pretty fast.

> also affect performance. I was wondering if anyone could give me some
> idea of how useable the Falcon is in the following areas:
>
> -How long does it take to decode a 640x480 JPEG file?

About 2-3 seconds I think. On an unaccelerated Falcon using DSP.

> -What sort of speed does it play MPEGs at?

Mostly about 12-17 frames/sec. unaccelerated, 16-21 frames/sec. on my Falcon.

> -Are there any good DTP programs available, and how fast are they?

CalamusSL is a very good professional DTP-package, better than Quark on PC and Mac
(my own taste at least) and there is DA's Layout also a good DTP-program.

Than there are the less professional ones like PageStream and TimeWorks and one or
two more.

> -Are there any good flight sims available that use the extra power of the
> Falcon, or are there only ST flight sims?

I don't really know about Flight Sims, but I have some other good games in my Falcon.

> Also, I have heard various alternative desktops mentioned, Ease particularly,
> but have seen no screenshots or details anywhere. Can anyone give me any info on

Well if you e-mail me at chainxor@control.auc.dk , I shall see what I can do.

By the way, if you get a Falcon, I recommend MagiC 4 as the operating system, it's
a LOT faster than the original TOS 4.04. and has pre-emtive multitasking.

> Finally, are there any Mac emulators for the Falcon? If so, roughly how much do

> also be appreciated. I have a choice to make, buy a Falcon or a Mac....

I don't know, but I think the Arc is better than a Mac, but than again it's my taste.
Falcon is ideal for direct-to-disk recording - definitly, especially if you wan't
direct-to-disk cheap.

>might have to manipulate your computer-case.

No you don't- if you use the right kind of drive!
I've used the SONY MPF-520-1 HD drive and with minor modifications to
the drive mechanics themselves (cutting off part of the metal lug for
the eject button to be exact), I was able to use the old eject
plastic button and plastic front panel. From the outside it looks just
like the old 720K drive!!

>> Do dips need to be set, the room rearranged or sacrifices made? I know less
>>than nothing about this and would appreciate any help that anyone could lend.

Well, you do have to do that, but no worries since I spent over a
month trying to figure out how to do it (no thanks to Sony!!!), but
thanks to someone else on the net though- you know who you are!

It involves soldering a couple of jumpers together, and the disk drive
cable has to be inserted the "wrong way" (upside down). The power plug
fits in the same way as before though.

So why do you have to mess with these jumpers? Well, the ST has to
know when a DD and HD disk is used, and gets a "density" signal from
pin 2 of the drive.

In addition to the drive itself you need some electronics- more
precisely an electronic circuit which you can buy or make yourself.
Seeing that you're in Germany there are several companies that sell
them. You need to solder this on top of the 1772 drive controller chip

(or better yet, desolder the 1772, install an IC socket and re-insert
the 1772 on top of the circuit which goes in the socket))
If the 1772 doesn't work with HD disks you might have to change it to
an AJAX chip which can even handle 2.88MB disk drives/disks!

Email me if you need more info or explanation.
Good luck!

1.6MBytes? Not 1.44? I guess this must mean that you used some sort of
extended format, which naturally will make it non-MeSsyDOS compatible.
I think your best bet is to try and find someone with an ST equipped
with a HD disk drive and copy the files over to MSDOS formatted disks
again.

I would be nice, if the Hades could be Falcon-compatible and if Falcon-compatiblity is impossible (Because of C-Lab/Atari) than at least STe DMA sound support and STe/TT comp. graphic modes.

Or else a Falcon with a AfterBurner040 would be much more interesting, has more possibilities.

www115 looks great offline, but it doesn't work at all online... I just deleted the old CAB-folder and replaced it with the new one, is there something else I should do?

There seems to be a problem with the cache, and CAB chrashes big-time when I try to use it on-line.

I think it is important that we get an increase in the developement of software for machines like this. If people started developing software and posting the algorithms on the net we could soon have lots of TOS specific software of a high standard. What we need is a central programming store, somewhere like Imperial College, or Hensa. If this happened and Atarians got together over the net we could have enthusiasts developing software for hobbyists, such as games like doom, in the PD. Once one had been developed other people could take the game and develop it into another game with the same engine, but bigger and better, or with a different plot. There are only so many types of games, so after routines written for sprite shifting, playing tracker tunes, 3d, texture mapped 3d, it would be fairly easy to make games in the PD that are up to modern PC standards. All we need is for artists, musicians, programmers, designers, etc. to unite over the net. It is possible, and the benefits would be huge.

On a related note, does anyone know if there's an 'official' LaserJet 4 driver for PageStream? I don't know of one, so I have modified PageStream's LaserJet 3 driver to do 600dpi printing (and RLE data compression, since it otherwise takes over half an hour to print a page at 600dpi).

If anyone wants this driver, please let me know and I'll try uploading it to atari.archive.

I'm not sure it can be classified as PD or shareware, but it doesn't really matter since you need the original Geneva disks to be able to upgrade. The upgrade patches the original files. It's free, and you can get it from any good FTP site. You can also order it from Gribnif for $5 US.

3317. Magic or Geneva?

Newsgroup: comp.sys.atari.st
Date: 1995-12-07 00:00:00 UTC
From: MICHAEL.CLEMMETSEN@Sunderland.Ac.UK
Message-ID: <4a75c5$o2v@orac.sunderland.ac.uk>
Source record: 155100

I am wanting to upgrade my Mega ST (4MB) to a multi-tasking opereating system. This basically means Magic or Geneva. Does anyone have any experience of _both_ of these systems and can therefore give a comparative assessment? The magazines just seem to say they are both good, without going into any great depth.

From what I have read Geneva is more compatible with existing programs but slower than Magic, is this true?

I have tried the demo of Geneva 004 and have found it to crash with a similar frequency to MS Windows, e.g. when quitting QED.

I _do_ like the look and feel of it and wonder whether the release version is any more stable. All the fun would be taken out of using my ST if it were to become as flaky as a PC. Running Geneva on top of MiNT 1.12 does not increase stability and makes the machine even slower. How does Magic compare?

I like the way Geneva runs TOS programs - it seems to be pretty stable doing this. What is Magic like?

Too many questions I fear, but any answers at all would be appreciated.

Thanks,

Michael

>Peter
There are no programs that I know of, although there is GEMulator: the
hardware/software Atari emulator which might be able to read Atari disks
formateed to 1.6MB. Contact Darek Mihoka for more info.
http://www.halcyon.com/brasoft/

If these disk were formatted at 18 sectors per track, then
the PC will probably read them as is (that would give you about 90 tracks per
disk @ 18 sectors per track for 1.6MB). the only other way I could think of
would be to use Norton disk editor to copy sectors directly from floppy to
hard drive/floppy

I strongly agree with you; we DO need a central "cache" for Atari-related programs from all over the world! Right now, I think, very many great programs, and especially updates, demos, etc. can be found in German Maus-Net, but not anywhere else. Many great programs never reach Internet...

This central Atari-site would serve as an update central where people could find the newest drivers, program versions, forums for communicating with program developers, etc. For a small community as we are, this _really_ could mean a lot!

But how could we convince especially the German software developers to use Internet? How could we get e.g. Steinberd, DMC, Digital Arts, and those other "giants" to join this idea?

Sorry, I can only tell you about my Geneva-experiences. Maybe it might help
you, too..

: I have tried the demo of Geneva 004 and have found it to crash with a similar
: frequency to MS Windows, e.g. when quitting QED.

I've hear many people complaining about the demo.. The release version is
quite stable, however. I use it on my Falcon, FX-accelerator, 8 MB RAM,
and the excellent THING 1.0 desktop. Works like a charm!

I wonder, whether NeoDesk might cause the problems many people have had?

It's fast (not much slowdown even when using many programs at the same time),
and it doesn't mess up easily - even if some nasty program decided to crash,
Geneva mostly doesn't care at all, so the other programs continue their
living as usual.

On the "down"-side there are things like:
- Not very usable with only 4 MB of RAM (probably MagiC shares this)
- Very CPU-intensive programs can block Geneva giving no time for
other programs
- There are still some problems with running TOS-programs in a window,
at least when using THING desktop.

Greetings,
Tommi

There is a guy who wants to set up a BBS on a ST. He doesn't like BBS
Express ST, so he's looking for other software that he can use. Please
E-Mail me the name/address/phone number/e-mail address[if any] of
anyone that's supporting somekind of BBS software.
I run Express myself on my BBS.
Black Hole BBS 1-808-696-7763 300 to 14.4kb.
```

3330. HERE it is: 50khz-Stereo-Hd-Player

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: daniel@informatik.tu-muenchen.de
Message-ID: <4a9alo$64i@sunsystem5.informatik.tu-muenchen.de>
Source record: 154813
Body handling: Inline uuencoded payload not displayed: push.prg

Finally, I've written the Sampleplayer I've been asking for, on my own:

The player features:
- DMA-quality
- 6,12,22,50 Khz
- Mono/Stereo
- Samples any long
- Harddisc loading while playing
- Auto-repeat

It will run only on STE, not ST.

```
************************************************************
* You can extract the program directly from this arcticle. *
************************************************************
```

You only need Gfa-Basic. But there is one thing left to say:

If you want to play a sample, eg. 340MB long, than you have to split the sample into files, that are smaller than half your computer memory. All files must be of the same length. The files must be named with extensions (eg. TEST):

```
TEST.0
TEST.1
...
TEST.70
```

If you run the program, a fileselector box will occur and you've got to choose the file TEST.0, and then you can choose the rate, ..., and play it.

(Example: You want to play a sample that is 8 Mbyte long and you have 1 MB free. Then split the sample into 16 parts, called sample.0, samle.1, ..., sample.8 . Run the program and click on 'sample.0', choose rate and stereo/mono, and the player will play your files.)

HERE IS THE PROGRAM:

The program consists of two part, one basic, one machine code.

First the Gfa-Basic part:

```
' ---------------------------------START-----------------------------------------

' 50 khz Sample Player by Dirk Daniel
' daniel@informatik.tu-muenchen.de
' (c) Dirk Daniel 1995
'
```

I have a Macintosh Quadra 660AV (25mhz 040, 24RAM, 500HD, and full video capture), I have put a demo of MagiCMac on my machine and have had very little succses getting aplications to work, if you have MagiCmac and know some good applications to try (3D rendering, PhotoWork, Games, Video) could you please tell me which ones work best and what kind of speed gains it has over finder based applications.
Thank You

3333. Re: STeelers

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: guy@swampdog.demon.co.uk
Message-ID: <818401498_OASIS_@swampdog.demon.co.uk>
Source record: 154856

In article <818365990_OASIS_@ravanol.demon.co.uk>
alastair@ravanol.demon.co.uk (Alastair Shortland) said:-

[snip]

>Oasis is certainly a very good program.... I wish I could get it to
>work under MagiC, but it doesn't for some reason. When I call NOS
>from Oasis it isn't loaded :(

Install Oasis without any of the MagiC options. Set the NOS
environmental timezome variable in MAGX.INF to

#_ENV TZ=GMT0BST (for the UK)

Rename NOS.TTP to NOS.PRG.

In Ease go to "Options - Applications" and install NOS.PRG as single
tasking and assign it a keyboard shortcut. Also set up its command
line to "Predefined" and set it to:

-d G:\OASIS -s 40 startup.nos (changing the path to where you have
Oasis)

You can now execute NOS via the keyboard shortcut. When it terminates,
execute Oasis then Select "Internet" and "Unbatch".

You will have to find your own way of setting NOS up if you have some
other desktop other than Ease.

[snip]

NOS can be run from within a VT52 window but invariably causes the
system to fail at some point afterward, no doubt the result of two
multitasking things argueing.

3335. ISO to ST converter/multiple replace editor?

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <30c862a2a3b113@sn.no>
Source record: 154858

Has anyone seen a program that converts ISO (8859-1) characters into
the equivelant Atari characters?
I know this would be really simple to make, but as I'm not a
programmer I have to rely on readily available programs.

One thing that also comes to mind would be some sort of text editor
that lets you find/replace several different things at the same time,
and that these words/sentences that should be replaced could be
saved/loaded as needed. I could really need this for when I edit my
web pages and need to change paths or something on every single page.

Hallvard

3337. Help--"Bad ROM CRC" on ST

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: chambera@cs.pdx.edu
Message-ID: <4a9vda$qov@sirius.cs.pdx.edu>
Source record: 154860

Help! Yesterday my 1040ST (with TOS 2.06 and AdSpeed accelerator) began to crash frequently, with three bombs each time. I turned it off for a while. When I turned it on again it gave the message "Warning: Bad ROM CRC in Chip E" and crashed with two bombs. Didn't even try to read the hard drive. I turned it off and on several times with the same result.

Today I took it apart, removed the TEC card from the main board and the TOS chips from the TEC card, and cleaned everything and put it back together. Now it all works fine.

Should I be worried? Was it just a loose connection? The TEC card seems like such a simple gadget, I can't believe it could be malfunctioning... and ROM chips rarely go bad, correct?

Advice would be appreciated...

gmon@clark.net schrieb am 05.12.95 in der Msg A42773@AC3 (Gruppe comp.sys.atari.st):

G>Has the Medusa actually ever been sold in volume?

No, the Medusa is more or less hand-made.

G>I don't personally know of anyone that has one.

I know several people with a Medusa, and i own a Medusa by myself for 2.5 years.

G>It seems like these machines have only been in the prototype stage.

Thats true for the HADES but not for the Medusa. The Medusa is a very fast and stable system.

G>The Hades sounds like it has the most potential of the two

No, the HADES isn't as fast as the Medusa. The HADES has an easier and slower memory-design, as Fredi Aschwanden (developer of Medusa and hades) explains to me and the feature of an PCI-bussystem. But where are the drivers/control-programs for the PCI-bus-cards?

G>but they have to get them out in volume

I don't see any chance to produce the Medusa or Hades in volume. Compare the price with a Mac! IMHO Medusa and Hades are systems for Atari enthusiast.

Floecki

Source record: 154869

Tommi Hietavuo TKKK (thietavu@news.abo.fi) wrote:
:
: On the "down"-side there are things like:
: - Not very usable with only 4 MB of RAM (probably MagiC shares this)

Geneva use less memory than MagiC. It`s propably THING that eats memory.

: - Very CPU-intensive programs can block Geneva giving no time for
: other programs

This is because of the way Geneva multitasks. Basically Geneva is just a multitasking AES, so programs multitask only when they call the AES. MagiC is preemptive, which means that the OS force all programs to multitask. Geneva will do this if you run it over MiNT.

: - There are still some problems with running TOS-programs in a window,
: at least when using THING desktop.

I`ve experienced this when running Gemini. Gemini traps all tos-programs and try to run them in it`s own shell. But so does Geneva... It can be cured by setting the TOSRUN-variable in GEM.CNF

I`ve used Geneva 004 a couple of months now (Demo only...) and I find it very stable. You can`t save the setup in the demo, so I`ve been running it for days without any trouble, just to avoid having to set it up everytime I want to use it.

I`ve also used MagiC 2.01 (On a MegaSTE and on my Falcon (Patched)) and found it very fast, but not as powerful as Geneva. Don`t know about MagiC 4 though, I`m looking forward to try it...

Yes, but they need the V12 because even a light aerodynamic car (like
a Yugo {[:-)] ?) can be sluggish when towing the Titanic.

And if you spend a while looking into newsgroups devoted to other micros
and to M$, you'll often find the following .advocacy type of message from
Mac users :

"Microsoft deliberately put slow-down loops into the Mac software so they
could sell more copies of W95 on PCs that run <M$ application>"

Such a war is raging right now...

Must get back to my front row seat...

The USR Sportster supports Class 1 fax commands only. There is a
Class 1 fax driver and instructions included in the Junior Office 3.04e
package.

UDS have pulled out any further development on the STE/Falcon of their current products. Merlin, however, are going to develop their games further taking them to the ultimate conclusion.

If you have any suggestions for any improvements to Obsession STE and Obsession Falcon, please email me here at Merlin and we will try to take them into account.

3355. HiRes monitor?

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: Tjipke v/d Plaats <plaats@cs.utwente.nl>
Message-ID: <30C81F23.2781E494@cs.utwente.nl>
Source record: 154878

Hello,

I have a question wich I hope some of you will answer.

My brother has an Atari mega st (with I think 2M ram) with an Monochrome (HiRes?) monitor, wich he uses mainly for midi stuff. But sometimes he will play a game (who doesn't), but then a problem arises. Almost all games don't work on his computer or work without something visible on the screen. (you hear the sound but don't see anything).
A few of these programm's gave an error like: "you are using a HiRes screen." I conclude from this that some games don't work on these type of screens.

Can anyone of you tell me more about this, like is it possible to play these games in an other way? Please give us some info!

FrGr,
Tjipke (plaats@cs.utwente.nl)

Date: 1995-12-08 00:00:00 UTC
From: jpb3@ukc.ac.uk
Message-ID: <14076@gos.ukc.ac.uk>
Source record: 154879

I'm on the Atari Micros Hensa mailing list, and I've been noticing
recently that I'm not getting the updates.

I mean, I can still go to the FTP site every so often and look for them,
but the mailing list a much nicer method.

Has anyone else spotted this, including Denesh??

Errm, that's all.

John.

3360. Order POSITIVE IMAGE here

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: efac001@alpha.qmw.ac.uk
Message-ID: <4aabmo$ke8@epsilon.qmw.ac.uk>
Source record: 154883

TITLE: Positive Image

CyberSTrider is currently undergoing expansion, bringing you commercial products too. The shareware scheme is here to stay, and will continue to grow. In the meantime, if you wish to be on the CyberSTrider mailing list, please e-mail me. There will be two lists running... one for the shareware scheme, and one for the commercial products (hardware and software). Messages will go out everytime there is an update... so do e-mail me for whichever (or both) list(s).

CyberSTrider is also now able to offer you the chance to buy Positive Image, the 24-bit Image Processing Package for any Atari.

+ Supports all ST, TT and Falcon resolutions
+ Edit 24-bit true colour graphics on an ordinary ST
+ GDOS, Speedo, NVDI, GEM compliant grafix cards, ScreenBlaster, BlowUp, virtual memory drivers, TT fast RAM, Geneva, MagiC, MagiCMac, and Gemulator compatible.
+ Powerful block handling
+ Create 3D random dot stereograms and foreground enhanced stereograms
+ Uses the Falcon's DSP
+ Outputs to most mono and colour dot-matrix, inkjet and laser printers
+ Images can be rotated to any angle to an accuracy of one degree
+ Image rescaling up to more than 400%
+ Images can be printed to disk if memory is low, and then directly from the desktop
+ Numerous filters available and the ability to create your own
+ Supports 256 level (8-bit) masking, and includes a configurable gradient tool to aid mask creation.
+ Allows processing of user defined areas without affecting other parts of the image
+ Includes a number of localised retouching tools which are fully user configurable.

Positive Image is available at a special price for a limited period. An introductory price of just #65 (normally #79) plus postage and packing (UK-#2.00 ; Europe-#5.00 ; Rest of World-#10.00)

(Prices above in UK Pounds)

To order, please make cheques, eurocheques, money orders payable to:

CyberSTrider or DENESH BHABUTA

and send to

CyberSTrider
203 Parr Lane
Bury
BL9 8JW
UK

Do note that the program is currently 99% complete and should be available before Christmas. Any payments will not be cashed until the order has been fulfilled

Please ask if you have any more questions...

EH> through walls and such before stopping you.

Yes there is no "collision" detection of walls in the current distributed version, but there is a new one with this. The only problem is that the guy who have done it lives in france and you all know how it is there now days. ;-)

It will come up on the mailinglist/WWW as soon as we get it.

EH> What is the next step in BadMood's evolutions? Do they pan to add
EH> texture mapping? Will the implement the opposing characters? I would
EH> love to see this eveolve into a full-fledged game!

The same guy that have done the non-ghost-mode have also made routines for reading and displaying textures but no mapping yet. This part will probably be done by Doug Little (of Apex fame) when he gets the time for it.

I were told not too say this, but Doug have some crazy ideas about networking, but we have to see if it will be implemented (we are talking about more than 4 computers...). :-)

The goal is too make it a full-fledged game with the ability to run Doom 1, Doom 2 and Heretic WAD files. It does that already. :-)

Cheers,
Magnus Kollberg

3368. Hard Disk Write Errors

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.91.951208223850.19904B-100000@moose.erie.net>
Source record: 154891

I recently put a Seagate ST1480N (420 Meg) hard disk in my Mega STe. (TOS 2.05, ICD 6.5.5 Pro boot software). Ever since then I get "Write Fail" error reports during Zmodem downloads. I have the booter set up with write verify on. I've tried the write cache on and off with the same results. I have NEVER had a "Write Fail" error when doing hard disk operations from the desktop or from Universal Item Selector. It ONLY happens during Zmodem downloads.

I have tried some of the more obvious things like a different terminal program. I usually use STorm, but tried Connect which has different Zmodem routines and got the same results. I am running HSMODEM and re-installed the DRVIN, MFP, and SCC programs, making sure they're in the right order. I also checked the order of the other files in the AUTO folder and re-installed the hard disk boot program.

I never had this problem with my previous Quantum 240LPS drive even though I'm running exactly the same software.

How can I get these "Write Fail" errors only during Zmodem downloads??? How can I eliminate them??? I believe this must be software related since I never have problems from the desktop.

: extended format,

If you look into original Microsoft literature (such as the
Microsoft MS-DOS Encyclopedia), you will notice that even this *is*
a valid MS-DOS format. The problem seems to be the braindead BIOS
implementation on most DOS clones.

Anyway, I have read about replacement floppy disk drivers for the
PC which can handle a variety of extended formats. Some of them
were even claimed to be shareware, so they might be available on
ftp servers. You might want to ask for more help in a newsgroup such as
comp.sys.ibm.pc.hardware.storage.

Toad Computers (toad@charm.net) sells software and hardware
upgrades for ST. ST Informer magazine is (I believe) the last remaining
North American Atari mag. It has reviews, and more importantly, ads for ST
vendors. Suzy Bee's sells compressed disks of shareware/pub domain
software. Many people list software for sale on this newsgroup (myself
included).
You didn't mention if you have a monochrome or colour monitor.
Some software will work on only one or the other, although most software
will work on either.
What type(s) of computing would you wish to do? Send a list, and
I'll recommend my favourite programs in each field. I sort of dabble all
around with Ataris, so I have tried programs in nearly every aspect of
computing. And there is some very good software avaiable for Atari to do
anything you might imagine which can be done with a computer!

You don't need the extended name files system anymore as they have
changed the way CAB saves the files in the cache folder! It no longer
tries to make nested folders for each site! All files go in one folder
with names like 00000001.htm and 00000025.gif, makes it a little hard to
figure out what goes with what site, but it's a heck of a lot more stable
this way!

3376. Advice on TT/Falcon video?

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: chambera@cs.pdx.edu
Message-ID: <4aa0q6$r9f@sirius.cs.pdx.edu>
Source record: 154899

I'm planning to buy in the next few months either a Falcon with a screen expander (such as Blow-Up) or a TT with a video card (such as the Nova). Does anybody have any recommendations for video add-ons for either machine? In particular, do they work with Linux/68k?

Thanks,

---Alex Chamberlain

Yes :) and I'm afraid I only have experience with MagiC so cannot do the
comparisons you were
after.

However, ... I bought a second hand copy of MagiC 2 some months ago for use
on STM with 4Mb and have never looked back. I have, at times, attempted
installation of MiNT and have never progressed forward
:{

MagiC is very small for what it does, very quick at doing it and has given
very few glitches with the s/w I use. I have now got hold of NVDI to run
with it and it's like having a new machine with improved usability and
speed.

I don't worry too much about the ST being underpowered for real
multitasking - it's enough for me to be able to have my applications
iconised and switch rapidly between them (I suppose I get around 4 in RAM
at any one
time).

: : (even with NVDI).

I guess you mean MultiTOS and not MiNT. MultiTOS is very, very slow, but with
only MiNT installed there is no slow-down. You can`t multitask GEM-programs
that way, but you can use MinixFS, MiNTnet...

:
: Tell me if you find out Alastair :), I am still awaiting a response re:

3384. Atari hardware/software for sale

Newsgroup: comp.sys.atari.st
Date: 1995-12-08 00:00:00 UTC
From: japolis@boulder.earthnet.net
Message-ID: <japolis-0712952344230001@199.45.146.107>
Source record: 154931

Hello! I have the for following items for sale, shipping is additional:

ATARI hardware/software for sale:
Atari TT030 in a steel tower case... 4 internal 5.25 inch drive bays
500+ meg hard drive installed
44meg syquest drive
TEN megs ST ram,
SIXTEEN megs TT ram... (26total)
TTM194 19inch monochrome
PTC1426 TT color monitor
8 bit color video card (coco)
IMAGE SPEEDER interface to an image setter... VERY FAST lino output!
Keyboard, mouse, docs, box, disks, misc. included.
This is designed as a professional publishing and image retouching
system... the system was designed for the DIDOT/RETOUCHE suite of
programs which are not included, but easily acquired from various sources.
I was asking $2500.00--- now REDUCED to $1500!

Atari 1040 ST with DS/DD drive, color monitor, lots of programs included,
bunch of blank disks too. $200

Codehead Utilities, release 3.....$10.
G+PLUS 1.3.....$15.
MultiDESK 2.1.....$15.
Image CAT .....$20.
Mini Office (Nicely done graphs and stuff, from UK) .....$25.
OIDS and PINBALL MAGIC (games).....both for.....$15.
All six for.....$60

MAC software and hardware:

PageMaker 4.0, manuals, disks, box, etc. use for cheap upgrade- COMPLETE $100

Adobe ILLUSTRATOR 5.5 upgrade disks only, no manual $50

Backmatic 2.0 highly rated automatic backup utility $10

Aldus Freehand 1.0- use for cheap upgrade! $25

Iron Helix CD game, great!, complete with disk and manual $25

Serial cable for Mac. $5 includes shipping

Intermail/ Microsoft mail 1.36. many users. $5 includes shipping

Rental Center helper software and disks and big manual $5 includes shipping

Solitaire Royale disks, box, manual $5 includes shipping

Car Stereo items for sale:
All items are used but in working condition. No, They are not stolen, I just went through a phase where I liked installing and swapping around the stuff. Life's too busy to mess with it now. My lack of free time is your Big Audio Bonanza. And no, I'm not a dealer.
Some items have boxes and/or instruction books.

Car Stereo:
Mitsubishi RX791EM AM/FM High Power auto reverse cassette deck I don't know the power output other than it says "high power" on the front and it was always plenty loud for my rock and roll. There is a color code table for all the wires and connectors so you'll know what goes where. All parts are there, faceplate, knobs, etc. and it is the two-knob kind (not DIN) with an analog tuner, pushbutton presets, auto reverse, Dolby, and "NK" noise killer. All in all a pretty good deck. $make offer

Car Stereo AMPS:
Craig PowerPlay 48 watt amp $make offer
Concord HPA51 100 watt amp $make offer

Car Stereo extra special stuff:
Yamaha YEC-400 Electronic Crossover $make offer

Car Stereo Speakers:
Sony ES-S52 40 watt Coaxial 5.25 inch round speakers with grilles $make offer
Kenwood KFC-162 25 watt Coaxial 5.25 inch round speakers with grilles $make offer
Craig V203 10 watt Coaxial 5.25 inch round speakers with grilles $make offer

Car ALARMS:
Cliffalarm IMS (interior monitoring system) made by Clifford. Remote operation from fairly far away. Siren chirps when alarm is set or unset. Visible flashing LED in the car warns theives that the car is alarm protected. LED on the remote tells you remote is working fine. Panic alarm feature sounds the alarm if you hold down the remote button for 2 or 3 seconds. Shock and motion sensor is sensitive to breaking glass, but not to leaves dropping or cars passing by. Door triggers. Automatic reset after predetermined time to protection mode.
$25

Audiovox car alarm *BRAND NEW IN BOX* $50

Home stereo stuff:
DBX NX-40 Tape noise eliminator and disc decoder. Much better than Dolby. $make offer

CAMERA stuff:
Hasselblad view screen for 500CM:
Plain screen #42200- $20

Zeiss Ikon/ Contaflex 35mm camera marked "(lightning flash symbol) matic" on the top, and Contaflex on the 50mm 2.8 Zeiss lens, Compur-x leaf shutter. Lens is "convertable" variety, switchable from 50mm to 35mm by changing the front elements, although I only have the 50mm lens element.

Built in meter, and even a rudimentary "auto" mode. With case. I'd call it very good condition... no dings or dents, the textured black covering is perfect, the chrome is perfect, and the black finish is perfect. Optically, perfect. The only rough areas are the battery compartment has a little corrosion on the inside and a little brassing on the outside. A "ready-case" is included but the leather is torn where the front connects to the back of the case. Surely a collectors item- $150

Metz SCA-351 adapter for Leica $25

Jeff Apolis 303-473-0511

That must have been a typo... Yes, it works on both VGA/RGB...

> fast, even on my unaccelerated Falcon. The only flaw I find with its
> current incarnation is it usually lets you poke a bit of the way through
> walls and such before stopping you.

Um, actually, it lets you go all the way through them - the version you have
doesn't have the 'anti-ghost' (ie you can walk through walls) routine. If you
know in which direction to go, you can go straight from one part of the maze
to another. (Ignoring the 'hall of mirrors' effect...)

Laurent has now written the anti-ghost routine, but it hasn't yet been
distributed via the list...

> What is the next step in BadMood's evolutions? Do they pan to add texture
> mapping? Will the implement the opposing characters? I would love to
> see this eveolve into a full-fledged game!

I think this is going to happen... I believe that Bertrand is working on
T-mapping...

From: jpb3@ukc.ac.uk
Message-ID: <14077@gos.ukc.ac.uk>
Source record: 154936

I bought my hard drive a few years ago, and it came with ICD software. Recently I've been looking at the application software, and noticing how poor it is. This started me thinking about how goos/efficient the actual driver is.

The speed tester that came with the Hard Drive says that I get 1.4meg a second, and 14ns seek time, but I still wonder.

Is it possible ot get free upgrades from ICD, or another option, is there some PD drivers that I could easily install, i.e. not have to reformat my drive??

Thanks for any help...

John.

of
f> memory message, even when the fax has only one line in
it.

I have no probs. with 4Mb and running under MagiC - but this info. is of no
use to you, is it
:)

So I re-booted my STM under TOS and included FREERAM. These are the memory
requirements:

Jr. Office on it's own:
160,500
Jr. Office + 4 page fax view:
673,340

So, 512Kb is grabbed whenever a fax is viewed. This doesn't depend on the
length of the fax as JO constructs the image a page at a
time.

This seems an awful lot of store for one A4 page but JO constructs the
ACTUAL fax image at 196dpi before mapping it to the screen at (say)
80dpi.

I have looked in the docs. and can find nothing about the minimum spec. m/c
required.

Looking at the figures it seems that you might just stand a chance of
geting it going if you remove all unnecesary AUTOs and
ACCs.

Hmmm.. I'll take your word for that :) BUT I have just been playing with a
demo version of Calamus SL and find that, under MagiC, its own file
selector freezes. I have had to turn "AltFileSel" ON to be able to use
Freedom with
it.

Background images need at least a 16 color resolution. And currently only GIFs are supported.

I guess you need a PPP connection for this and PPP software on your
ST. I'm no expert and have never used PPP myself, but from what i hear
all this is based on PPP connections/software where you have one
program to do each task instead of using Unix while being online,
typing the commands (I'd much rather use Unix though, as you can do a
lot more than just what those programs do).

Normally not - but we have programmed something, so that our old
ST will be a printer spooler for your PC or MAC using the ATARI Laser.

The software will be published in a few weeks in the german magazine 'ST
computer`. If you can't get that magazine, I think I could help you
somehow. Just mail me.

Some of these things, at least, can be done with the Oasis/NOS package, I
believe. For FTP there is also the excellent duFTP. Now that STiK is
becoming so popular (because of its inclusion in the CAB/STiK Web
Browsing package) some of these tools are showing up for STiK. But right
now it is all in the RSN stage.

This is probably the same problem as in the old versions. I think, it's a
bug in STiK and not a bug in CAB or in the cache management.

: pops up soon, I may be forced to buy a MAC as my next computer :(.

Though many people might disagree, I don't think the real alternative
is Mac any longer. It's considerably less compatible with the mainstream
file formats, peripherals, etc. than new Atari clones (e.g. C-Lab Falcons
and Eagle), and not even that much cheaper: in order to get that heavy OS
running well, you have to get a Power-Mac. MacOS really kills all lighter
machines =-(...

Eagle might be the ideal computer for us who like the way ST does things.
It's modern, fast (due to fast operating system), and not really too
expensive, I think..

> On the same topic, what has been changed in Junior Office 3.04
>relative to 2.01???
>

Don't know about 1 megs, but....

The new version is in ENGLISH - docs and program.

The icons on the layout screen have changed

The configuration still crashes under multitaskin MagiC

The fax send/receive module is now incorporated into the program, not as a
seperate ACC, even though it tells you it's configuring the ACC.

Setting up from scratch doesn't require silly
<loading-with-CTRL-pressed-down>
- type operations - ie much friendlier!

There's probably more, but I've not tested it much yet.

BTW it's on Hensa at micros/atari/tos/p/p173

Have fun - Andrew

> >sites that have Atari formatters which do proper MSDOS formatting...

I just read the FAQ by Steve Wells and it's quite good. It basically covers some good points. However, I want to say two things about it...

Steve mentions that you can cover up the hole with tape to fool the PC into formating the HD floopy as 720K. Computer law states that you shouldn't do this at all since it use a thinner magnetic coating and will be prone to failure. Actually though, this has yet to happen to me. I used a HD floppy(in DD format of course) for Insectroid and for downloading large files off a BBS. No problem yet, but still... :)

Oh, you can find programs that will format the disk in DOS format on the ST; but I seriously recommend M-Disk. Set at 80-9-2 sides, it will format disks that always work on a PC. It will even tell you how by clicking on a button. I have 4.94 which I like very much(I tried the latest version, but it's not the same you know).

Thanx Steve for this very useful FAQ. :)

New software for the Atari TOS section

New packages are as follows; type "cd ~/micros/atari/tos/<x>/<code>" to get to
where they are held. <code> is as below and <x> is the first letter of <code>.
EG. For package "m100" you'd "cd ~/micros/atari/tos/m/m100".

> TT with 4 megs of ST ram and 4 megs of TT ram, TOS 3.06.

I'm running WWW115 on a Falcon 4/65+85 TOS4.04 and this problem doesn't occur. Maybe your caching set-up needs adjusting - for when you first un-zip WWW115.ZIP, the cache settings for the Hard Drive (on the right when you select Cache... from the menu) are set so that 10MB are reserved, but 10MB are kept free. Consequently as soon as you try to access anything you get an error message - something like unable to read file 0000001 - because the HD cache limit has been reached. Try setting for example 10MB reserved and 1MB to be kept free - this solved the problem for me.

Hope it works,
Andy

: bug in STiK and not a bug in CAB or in the cache management.

Ah, the author himself! Congratulations on a beautiful program
Alexandar. I remember tha OCR was a beautiful program too.

BTW, I've had pretty good success using CAB on-line, but I too get
perpetual crashes at certain sites. I'm not sure what is going on. It
seems to be more prone to happen on CGI created pages than good old
fashioned HTML ones, but that could be my imagination.

The latest bundles release (www110.zip) seems to have something wrong
with it so that in 16 color mode it cannot display in grayscale or color
mode, I've had to go to monochrome dithered. The program seems to have
lost track of the second half of the sixteen color palette. In 256 color
mode it works in color. Does this sound familiar, or did I just install
in badly or corrupt it somehow?

Two things about the lovely new tables: they don't support borders other
than 0 and 1 (all borders > 1 default to 1), cell padding, cell spacing,
or caption bottom. Personally, I don't miss them. I suspect you knew
they were missing, but thought I would point them out just in case (I'm
not enough of an HTML guru to know how standard those commands are).

Well, I'm sending my money off to Jeffrey Wisniewski. It wasn't too clear
in the documentation, but I assume this only registers CAB and not CAB.OVL
and STiK, so I should send $ to Tim and Steve as well.

Would you mind a bit of a wish list? I think you know most of them
anyway. Support for inline JPEG's, FTP, GOPHER (these last two seemed so
close even in earlier versions, tantalizing), and MAILTO. Of course, the
ability to download files (the JPEGS or even .ZIP files people have
linked to their HTML pages) would go a little way towards easing two of
those needs. External programs like duFTP and ANTMAIL might work for
two of them (except linking to external programs hasn't worked for me, I
tried having the Apex viewers load the JPEG files, which used to work,
but doesn't with the newest CAB, CAB tries to read the file in stead of
just downloading it and passing it on the the external program. Same
with using ST-ZIP as an external program for .ZIP files [see, I'm trying
to work around that lack of FTP]).

I feel bad listing all these niggles about a program that is already so
much more than I expected, so much work, I'm sure. If I could code I'd do
it myself. The best help I can be is to beta-test and to pay shareware
fees, both of which I'm doing as best I can ;-).

Congratulations!

Your best bet is to find a local BBS which specialises in Atari - there is LOADS of high quality PD and shareware stuff and also a great number of demos of commercial products. I'm afraid I don't know any by name but there is quite a thriving Atari community in the Nordic countries. If you keep watching this area you will also find references to ftp sites which keep Atari stuff. The best are in Germany but hensa in UK is also a goldmine.

Not very :) I compared the ICD driver with that provided by Supra and
found the Supra around 30%
faster.

j> Is it possible ot get free upgrades from ICD, or another option,
is
j> there some PD drivers that I could easily install, i.e. not have

ICD release quite a few of their upgrades onto BBSs - you ought to be able
to find them there. They don't release, however, their PRO stuff like
CLEANUP and
SCSI.

Supra have released their utilities on BBS - look for version 4.02 or 4.10.
I have used their driver and utilities with HDs formatted by ICD utils. It
all works OK. You could also look for HDDriver. I have not used it myself
but have heard that it is speedier than
ICD.

More like a Honda CRX, methinks.

A Pentium running MS-Windows, OTOH, is like a Dodge Viper (terrible car,
but powerful) with triangular wheels.

Fret not! It's probably just the ROMs loosening in the sockets. If you still had the card out I would recommend re-making soldered joints just in case you had one which was "going
dry".

Yes! This is a really coherent range of computers! You are not dealing with
Megadosh here
:)

Just avoid anything marked as Falcon-specific as this m/c uses a 68030 chip
and the s/w might try to exploit it
:)

Apart from the english dialogues in the "E" version the program has changed
structure so that Compose, Configure, View and Driver modules are loaded on
demand by the base
program.

What is going to happen to the people who payed the money for the Falcon
version of Obsession about one year ago and did NEITHER see the game NOR
the money NOR did they see back their original disk of Obsession STE ?!?!
Does merlin send us that new version or do we get our money back from UDS?

Anyway, would be REALLY GREAT if somebody will continue UDS' great work!!!

> Does anybody have any recommendations for video add-ons for either
> machine? In particular, do they work with Linux/68k?

I recommend buying a Falcon with Nova graphics card, because CPU-
performance decreases if you just take such cheap graphics enhancements
like BLOW-UP for Falcon. If you want the BLOW-UP-FX-Card, and some FAST
RAM, it's OK, too.
But you cannot compare a TT+Nova with a Falcon+Blow up, because the TT is
too fast in that combination compared to a bare Falcon.

From: awood@f030.demon.co.uk
Message-ID: <818552416snz@f030.demon.co.uk>
Source record: 154720

I would like to say how impressive an update WWW115 is to CAB - the interface is improving all the time - but (and I hope it's me, not the software) I seem to have a problem with the sending of forms.

I have connected to a few sites where you have to fill in forms and have experienced 'bad' results.

Some forms works (especially those with only one or two inputs) but those with multiple inputs are giving me grief.

An example - http://www.futurenet.co.uk/ is a damned good site, but it is now 'protected' by a registration form which I have duly filled in correctly with CAB, only to have a page come back telling me that half of the fields that I have completed are empty and I should go back and fill them in again (which I did, several times, only to get the same response).

Is CAB sending the form back incorrectly, is it CAB.OVL, is it another STiK bug, or is it (hopefully!) something that I am doing wrong ?

Comments, suggestion, and HELP! gratefully received !

I'm going to be buying an ST for sequencing soon.

I've been watching this newsgroup to buy, and also noticed a lot
of postings that deal with memory upgrades.

They mention 256k and 1Meg simms. And that the fastest the ST can
access them is 150ns.. ms.. or whatever the SIMM speed is.

I have a LOT of ram around in various machines, and was curious what
the highest RAM config a system can use.

Could somebody enlighten me on how the ST deals with RAM?
The more details the better.

Thanks!

Dead right! Most games use colour for obvious reasons and use the low res. screen mapping to get the widest palette. There are just a few -chess, tetris, card games, draken which work in mono but these are few and far between.

The obvious solution is to get a colour monitor! You ought to be able to get hold of a second-hand analogue RGB for around
30UKP.

Another solution would be to find one of the PD programs which emulate a low res screen on a high res monitor by mapping colours to grey scale. I forget their names ATM, you would have to search through a BBS file areas to track one down. Even these may not work very well, though, as many games use illegal tricks to access the screen which may well fool the emulator.

Get a colour
monitor!

3431. WWW115 Bug

Newsgroup: comp.sys.atari.st
Date: 1995-12-09 00:00:00 UTC
From: fl@io.org
Message-ID: <4acg64$oug@ionews.io.org>
Source record: 154728

A friend and I have been trying out the new version of CAB and I believe we have found a bug in the file handling.

The new CAB wants to rename any documents it views as a numbered file (like 00000001.HTM) in your CACHE or WWWCACHE folder. However, it doesn't seem to be able to open folders to view the files within. Every time I try to open a URL (online) it wants to check the CACHE folder first to see if it hasn't already been downloaded. Since it cannot open the folder, it reports an error.

You can see this error in another form when, on the supplied HOME page, you click on the link to view the various partitions on your machine's hard disk. Clicking on "F:\" gets me an overview of the folders on my disk partition, with each folder displayed next to a small graphic of an open folder. Clicking on the folder name, however, gives you an error message, and you cannot proceed. Should there be an .HTML or .HTM document in the root directory of this partition, it will open this just fine. My conclusion: the new CAB cannot handle folders properly.

When attempting to gather some new documents to my new CACHE folder, while online, I sometimes get some files written in there (typically 00000001.HTM and CACHE.CAB) but these are invariably 0 bytes long. My conclusion: CAB cannot write files within a folder.

My conclusions are based on my suspicions that the new file handling code (the one that wants to deal with numbered file names rather than text like the v. 1.08 did)is such a substantial rewrite, that some file handling errors crept in.

These errors occur on both an STfm 1 meg machine, TOS 1.04; and on a TT with 4 megs of ST ram and 4 megs of TT ram, TOS 3.06.

Any help would be gratefully received.

Regards,

---

I think this is the important hint. Since you have the important patches
(HSMODEM) and tried well proprammed terminal programs (CoNnect), the
problem can be due to only HD driver and HD. Did you try a different
driver ?
Maybe your new HD recalibrates itself sometimes ? If that happens during
Zmodem, Zmodem might get data faster than it is able to write to the HD
because the HD just need a second to recalibrate. Try to use a larger
buffer for the Zmodem or see whether the recalibration can be switched
off.

Cheers Peter

3437. mono monitor problem

Newsgroup: comp.sys.atari.st
Date: 1995-12-09 00:00:00 UTC
From: jnorton@nilenet.com
Message-ID: <4acg48$sii@thoth.nilenet.com>
Source record: 154734

I have a MegaSTE with TOS 2.05 and monochrome monitor. I use a screen saver (Silk Mouse) that reverses the colors (black/white). When it activates, some text and lines on the screen have little lines that start jumping to the right a tiny bit. It also shows up when I intentionally reverse the colors from the control panel or when I run a program that reverses the two colors. It looks terrible and is very disconcerting.
I thought maybe a spec of dust was causing a slight short in the computer or there was a problem with the monitor. Help!

3438. serial 2 speed

Newsgroup: comp.sys.atari.st

From: jnorton@nilenet.com
Message-ID: <4acgd0$sii@thoth.nilenet.com>
Source record: 154735

I am now using serial port 2 with my telecom program (STORM). I understand that HSMODEM or FSERIAL will allow it to work at max speed. I have TOS 2.05 and so I use Medical Designs Serial Fix (SERFX20.PRG) program to correct problems with TOS 2.05.

I have tried to use both HSMODEM and FSERIAL. However, I just don't understand from the instructions which one is right to use, or how to use or how to use with SERFX20.PRG. Any help would be appreciated as I use the net a lot and any speed increase in d/ling would help.

3439. Where is Computer Insel from the NOVA cards, and other companies??

Newsgroup: comp.sys.atari.st
Date: 1995-12-09 00:00:00 UTC
From: Jan Dooms <jandooms@tornado.be>
Message-ID: <4aamlc$im6@tornix.tornado.be>

Hi,

Computer Insel, the makers of the NOVA graphic cards, are somewhere, but I don't know where. Although I wass at ProTOS, and searcht everywhere, I didn't find an e-mail address, normal address, phone number...
Does anybody know? Or when you know other addresses of other companies providing Atari products, just send all the info you've got to me, I'll be very much delighted!!!

Thanks in advance!

Greetings, Jan Dooms.<jandooms@tornado.be>

From: hallvart@sn.no
Message-ID: <30c8e170f95cd1@sn.no>
Source record: 154816

You can solve this problem 3 ways:

-Get a Multisync monitor (like the NEC Multisync II I have) and run
all three resolutions, using a switchbox, switching between colour
low/ and monochrome high resolutions.
The ST reboots each time you throw the switch.
The mono display isn't quite as sharp and clear as Atari's SM124, but
quite usable still (I've had mine for over two years, and I use mono
just about all the time).

I don't have anything to compare with when it comes to colour, but I
read somewhere that the colour on the Multisync was in fact a little
better than on the SC1224 or similar!). You gain some and lose some.

-If your computer has an RF modulator output, you can connect a colour
TV to it and get a colour display fro games etc. and use the
monochrome monitor for MIDI, wordprocessing etc. But you have to
disconnect the mono monitor every time you want it to display colour
as there's a monochrome detect connection in monitor connector- or you
can get/build a switch for it.

-You can get hold of a colour monitor in addition to the mono monitor,
as well as a switchbox between the two of them (or unplug the one
you're not using for the moment- if you don't mind wearing out the
monitor plugs on your ST/monitors).

Good luck!

I though TOS 5 has got things like list boxes, toolbars in windows, file
selector that supports long filenames etc etc.. Does NAES have any of these?

: > I read something about MultiTOS II.
: > Does anyone know when Atari will release it?

: Atari is OUT of the computer market, so no TOS II by Atari!

Atari will not release any new TOS version, true. However, MultiTOS
development is "continued" by Overscan in Germany, who developed N AES,
an AES replacement for the buggy and slow GEM.SYS of MultiTOS; it will be
shipped together with Thing (a Desktop replacement) and MinT; shippment
will begin on Dexcember 11, 95. The program was shown on the ProTOS show
in Heneff, Germany, and performed very well.
Upgrades for MultiTOS 1.0x users are available, so you can say NAES is
the sucessor of MultiTOS
Alterbatively, ypu can buy Magic 4.0
It is also said, that C-Lab are working on TOS 5.0, but until sth. is
shown, one can't say anything about this; as NAES and Magic4 prove are
good quality work, there is no need for TOS 5.0.

: >guitarist, and can neither read nor write sheet music, this is a wee
: >bit problematic.

Tsk tsk ... a lot of guitarists seem to have that problem. Causes
trouble when they want other instruments to participate in their songs.
IMHO, all musicians should learn to read music, but (unfortunately) many
guitarists take the lazy route. This isn't to belittle your mother ... if
she's self taugh and has a great ear, that's quite impressive.

: >It has been suggested to me that an Atari STFM could be used in this
: >context: that you could plug an acoustic guitar pickup into the MIDI
: >socket and play the music into the computer, which would then
: >translate it into the required notation.

It isn't quite as easy as that. Although keyboards can be plugged
into MIDI slots and have the music played on them transcribed by the
computer, the technology for guitarists is currently *VERY* unreliable.
The guitar operated on vibrating strings which are difficult for a
transcribing program to track and transcribe.

: >1) Does the Atari have software available that can translate MIDI to
: >sheet music?

Yes, but they seem to be for keyboards only. CUBASE is a good
place to start and I believe some of the Dr. T's programs have this feature.

: >2) Does the ST have the hardware necessary to interpret guitar sounds
: >and turn them into sensible notes?

No, but that's because no computers really have the technology to
accurately do what you ask.

: >3) How much would a decent second hand ST cost, and where would I
: >find one (in the UK)?

Check out ST Format magazine. I believe they often have
classified ads.

<snip>

Yes, had seen this information before, but in my understanding
this is enable you use a composite video input on a monitor with the RGB
colour output of the ST, which isn't quite what I was asking (thanks
anyway). The actual question related connecting a mono VGA monitor to an
ST for use in hi-res mode (ie 640x400 mono @ 70Hz scanrate). I know it
can be done as there are several companies in the UK selling modified VGA
monitors for use as an ST hi-res monitor but they are charging about 120
pounds for it. So does anyone know how it is done?

3450. HiSoft BASIC

Newsgroup: comp.sys.atari.st
Date: 1995-12-09 00:00:00 UTC
From: rickjnav@nic.wat.hookup.net
Message-ID: <4acjcl$25b@nic.wat.hookup.net>
Source record: 154825

This is a novice programmer question...I was lucky enough to
pick up a copy of HiSoft Basic at the TAF Flea market last month, i
and have enjoyed whipping up a few programs with it. My main problem
is that every time a program ends,
it returns a :Program terminated, Press any key to continue" message.
I wanted to install a program in my auto folder that would automatically
print the date and time to a log file any time the computer is turned on,
but the "program terminated" message interrupts the boot-up process, and
even though it does log the startup time OK, it defeats the security aspect
of the exercise.
Next dumb question...what is the trick to being able to get a program to
run as an accessory? If I write a program, compile it, and rename it .acc,
really weird things happen when I boot up. I wouldn't dare install this on
a hard drive.

Last question, totally unrelated...anyone know where I can get a
copy of Chameleon?

Thanks a bunch. Seasons Greetings to all.

Rick J.

No crashes but no URL's resolved either plus when I change the font
for the headings (NVDI), although it displays the change, this does
not carry across to the display window which remains stuck on the
system font.

The best way to go about it, is to assume everything will run until
you find out it doesn't.

The ST, STE, Mega, TT and Falcon all have different hardware but all
will run any program which has been written half decently.

3455. WWW105 - CAB wish list

Newsgroup: comp.sys.atari.st
Date: 1995-12-09 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <4act9p$b2p@gti.gti.net>
Source record: 154830

I've been playing more and more with CAB, and outside of my previous posts on, I have to say again I am really happy with it.

What is an adaquate sound player? I say "adaquate", because I would want a nice small and easy to use one, that I can run from inside CAB when I select a sound source. I have several, but they're too "bulky" for this (like some that are also recorders), and don't know if they support CAB's method of calling helper apps.

A question of CAB's cache. Is this a "checked" cache? Like in Netscape, if the document on the target host hasn't changed, the document is loaded from local cache. Does CAB do this or similar? Because if there is no checking, then the local cache is always loaded, you don't know if this is the correct page or not.

I wonder if the author(s) read this newsgroup? Well, in any event, I do have a couple of wish-lists; one is a "reasonable list", and the other is "would be nice, but..." list...

I do a lot of comparisions to Netscape, since it's the best browser in the world. It's not a fair comparision, but not far off the mark.

The reasonable list:

The status bar states "Receive x/0 bytes". I assume that last 0 is supposed to be the total number of bytes to be received. Netscape tells you the number of bytes/and or the percent of the document received, as well as a "document done" when finished.

Also, a "forward" button, or menu item would be nice. Again, Netscape has both "forward" and back. Sometimes I press back, but didn't really mean to. I could easily select the link again, but it does make it easier...

I don't know if they're part of HTML 2.0 or HTML 3.0, but Netscape (and others) have a "visited link" option, that lets me set different colours for links that I've already been to. (there are also other link tags, like alink, vlink, and at least one other).

Finally, this is two in one: a timeout feature. There's been times that I selected a link, and the host is unreachable, or something happens that I can't connect to it. A 60 second timeout would be nice. Related to this is a "stop" button, or similar. Sometimes people have links to hosts that are down or something, and a stop button is handy. When I press the stop button in Netscape, it seems to continue loading local page.

The "it would be nice" :-) list:

Java! (not extremely unreasonable: Sun has opened Java up for development,
and all it would take is a saavy programmer to give it a whack. And
I won't accept "An ST can't do Java" answer, because "they" said that
the ST would never support a web browser. Actually, personally, I
use a Falcon and TT)

Support for the mailto tag.

alie@athena.compulink.gr (Alexandra Makris) wrote:

>Keywords:
>Is it possible to use atari printer slm605 to other pc??

Not possible. The SLM sereis has no internal RAM, but rather relies
on the ST/TT to do the page layout in main system RAM and dump a
bitmap directly to the printer via DMA. This makes for a very fast
printer, but it is hardware-specific to the Atari DMA bus chain.

Of course, you could sell the printer for a fair price...

: > Do you mean background images? It works fine here...

I figured out that it doesn't work properly with transparent colored
GIFs. But a standard GIF as wallpaper, when viewed at 16 colors or more,
with wallpaper turned on in the Options dialogue, works for me. Except,
of course, when my 16 color palette gets corrupted (as I described in my
earlier post, btw, I said www110 but I meant www115). For some reason,
when I load into 256 colors and then change rez to 16 colors it works.
But if just load into 16 color graphics display as either all white, or
sometimes just wrong colors.

Expose for the Falcon can accept RGB output from the Jag. This
would give you the highest quality capture. The second option would
be the S-VHS output, but with much less bandwidth to work with.
A tape deck with RGB input would yeild the best transfer, taking
RGB direct from the Falcon (very costly). The NTSC output on the Falcon
does not have the bandwidth needed to produce broadcast quality video.
A high quality video scan converter (I use the Computer-Eyes
Genlock-Video Scan converter) produces a reasonable quality S-VHS
output and allows video overlay as well. As long as your working
with animation, and are careful with your color mixes, you can achieve
a good quality. You will have to "wing" the sound track. As you already
have the Falcon, and Apex I assume, you cost would be under $1000.00 U.S.
for the two. I also recomend Rainbow II Multimedia, inexpensive
and has a very nice photo studio (user friendly and fast, too).
Other option exist for the PPC and Amiga, but at a much greater expense.

Expose= $400.00 U.S.
Computer-Eyes= $550.00 U.S.

I've just bought an FPU for my Mega STE, can anyone suggest some
software that will use it (commercial or PD etc.) that doesn't need a
68030 proc as well ????

Fractal Generators, DTP rogs, art packages, anything ???

Fialing that is there anyone out there who can perhaps point me in the
right direction when it comes to programming for it ????

Thanks

No, that will go to a completley different #atari (on DalNet), normally much more stable and less lag than the 'usual' #atari (on efnet).

From: will@usa.pipeline.com
Message-ID: <4abcun$lmm@news1.usa.pipeline.com>
Source record: 154842

I need EVERYBODY's help out there PLEASE!

I have just been victimized by a computer mail order company scam.

WORLDWIDE TECHNOLOGY which usually has a 2 page advertisement
in Computer Shopper and sells everything from hard drives to memory,
took me for over $300.00. I placed an order for (2)4X9 ram chips and a
SCSI/PCI adapter, I also asked for 2nd day air shipping. What was sent
and charged to me was (4)4X9 chips, a SCSI/ISA adapter, a 1.6 GIG IDE
hard drive, and an Orchid video card. They sent this 4 days later but
charged me for next day air. I thought they had just mixed my order with
someone else's. But when I called back, they said I had ordered ALL these
items! I felt helpless. I kept my (2) ram chips I had ordered and sent

the rest back. When I recieved my VISA bill, I noticed the discrepancy of
their credit.

THEY CHARGED ME A 25% RESTOCKING FEE FOR THE ITEMS I DIDN'T EVEN ORDER!

I called my credit card company and they couldn't even help me. They
said it was their words against mine since the products were listed on
the invoice. ---I am now out $300---

AT WORLDWIDE TECHNOLOGIES, I talked to the top supervisor FRANK
and he was the most stubborn, rudest asshole I have come across at ANY
company. I was sincere the whole time up until I realized he was not
going to refund my money and this was just a scam. FRANK, the asshole,
was in charge of or a main part of this whole thing.

Now after threatening FRANK and his offsprings, I need EVERYONES HELP
PLEASE!
I am appealing to all those who have been taken advantaged before or
can relate to this nightmare I have gone through.

First, DONT buy ANYTHING from this company! and spread the word!

Second, Spread this message to as many message bases as possible for
everybody's sake. No one should have to go through this.

Third, To compensate the $300, I will call WORLDWIDE TECHNOLOGIES
repeatedly
everyday and say," FRANK, FRANK, FRANK, FRANK " and hang up. This

I figure, will cost them 27 cents everytime I call their 800#.

Fourth, To give them a taste of their own medicine, I will call and
place fake orders that will be heavy in weight and have them ship
it NEXT DAY AIR / COD elsewhere. The items will be returned to

them and they will have to pay for shipping and COD charges.

I am asking ALL of you to PLEASE help me out!
I have never been as pissed off or motivated to do something like this.
Please do ONE or ALL FOUR of these for the sake of getting rid of vendors
like these. Their phone number is (heres an easy way to remember):☐

1-800-MEMORY Assholes (1-800-636-6792)
WORLDWIDE TECHNOLOGIES (from Computer Shopper)
437 chestnut st.
Phildelphia, PA 19106
Attn: FRANK (the Asshole supervisor)
Hours EDT: 8am - 7pm m-f 8am-2pm sat

I will do this for the next 100 days (like the gulf war) and will
appreciate ALL the help I can get. Thanks and watch out who you buy from!

Do you have ftp access? Look into the info-mac and Umich mirrors. Or look
for "magic-mac" and "magicmac" using an "archie" tool.

An older version might also be found in Compuserve.

Just around these days we've released a new english demo version (around
v1.2.6) that hasn't been send to the internet yet, however.

I can't really offer you a great deal in the way of comparison. I'd
really like to be a person who can afford to have both programs, but I
have to stick with just one. From what I know Magic, actaully
re-writes lots of OS code, and as a result runs software faster (of
course it will run slower with other progs). So I think, as Magic
came after Geneva, go for Magic.

Unless you're going to run an alternate filesystem with all the bother that
brings, you might want to try one of those TLC utilities that allows you to
put non-standard characters in the filename.

I think it's called TLC_NAME

I find it very hard to navigate at hensa. What's the best way to find
files you're interested in? I have been using ftp so far, but I doubt
that's a good way to use hensa.

Simply copy \rsc\cab_e.rsc to the cab main directory and rename it to
cab.rsc. You have to delete the old cab.rsc before renaming it, though!

But first you have to be sure that the VGA monitor can handle the high
frequency of the mono putput of the ST. I think it's at 71 or 72KHz.
I'm using a Multisync monitor for mine. it also allows me to use the
low and mid modes (though I've ended up using only hires anyway).

I own Freedom, so I don't need another File Selector with these features,
e.g..

I don't know about the other features of N.AES yet, though.

Yep! N AES is fully AES 4.1 compatible, the last unreleased version of
Ataris AES; the file selector in AES is, however, a very simple one, and
the package inckludes and alternative fileselector (with all the features
you might want, including long file names).
NAEs has also improvements such as the ability to switch the menubar off.
Magic4.0 has also lots of AES imorpvemnets such as an enormously improved
file selector boy, the ability to put dialogs in windows and an
integrated font selector for GDOS that can be used by applications like
the file selector.

GRAHAM CORNELIUS (gccornelius@its.dundee.ac.uk) wrote:

: ii) Atari are going into the PC games market, because there is a lot of money
: to be made. It is a financial move, designed to provide atari with cash. It is
: NOT pulling out of the Jag market. I think that if it did it would be the end
: of the road for Atari, and I think they think that too. Atari are staying in
: the console market, because of the vast amount of money to be made. They would
: be stupid to move out of it anyway, after they have fought so hard to get to
: their current market position. Another thing to note is that the Jag is a lot

Yeah, of course, we heard the same thing two years ago with the Falcon;
Atari would promote the Jag because they can make money there to support
the computer line; development is just "on ice"; they will not give up
the computer line etc. etc. I Am sick of all this official Atari crap.

Fact is, the Jaguar has worldwide no market position wahts however; sales
are by far inferior to their competition, and in some parts of the world
(i.e. 99%) the Jaguar doesn't even exist (for example here in Austria or
in Germany, where Playstation and the other comopetition have 100% market
share as compared to the Jag).

Certain projects, such as the Sigma card for PCs, are never heard of
again. And even such simole things as a CDROM drive take year to come
out. Most of the people doing support and (hardware) development on the
Jag have been fired. I am ABSOLUTELY CERTATIN that here we will never see
the Jaguar in the stores in fair amounts.
Now take a look at thebalance sheet from Atari, or generally speaking at
the comopany size: In almost all areas therethe differences bewteen Atari
and the rest are in the amounts of some powers of ten. Many people wn't
accept, but Atari hase become a small to middle size company that -even
if it wanted to compete- couldn't do so. To much of trust has been lost;
the dropping of the computer line was a major error, such as the decision
to leave Continental Europe where they had the biggest market share.

IMHO Atari will do it as with the computers; they will makethe transition
to PC games manufacturer and until they didn't complete this task, they
will make the people believe, they are still behind the Jaguar. This
transition will probably take a year, but i do not expect Atari pushing
the Jag by the beginning of 97. I am no sinclap, I am writinfg this on my
Mega STE and I will use my Atari Software (no, the software written for
Ataris)for many years to come; but I do not trust a single word Tramiels
speak out (or do you want a list, of what theysaid and promised over the
last ten years --- at our newspaper (Atari only) we made such a list - it
is really laughable).

Hi,

Can't get Junior Office 3.4 to print.
There seems to be a conflict with NVDI2.5.
With GDOS installed and NVDI GDOS disabled,
I still can't get it to print.

Without NVDI installed it works fine, although
after an age.

Can anyone help or clarify NVDI2.5/GDOS compatibility.

Cheers,
Smn..

What modem configurations do you use with WWW115..? When I use 57.600 bps with MNP5 on, hardly any connections can be made without very frequent crashes ("runtime error..."), or total system lock-ups ("resolving..."). I haven't tried this 115 with 14.400 bps / error correction/packing off, but 1.07 seemed to work a little better that way. How is it? Can CAB handle fast modems, MNP, etc. at all?

Those runtime-errors prevent at least me for using CAB at all. As STIK stays fully functioning after the crashes (I use Geneva r 004 & Falcon), and the browser seems stable, too - could the problem be inside the .OVL -part of the program?

I also wonder, why CAB doesn't find most URLs; it can load about 6000 bytes, for example, and then bang - down it goes, or locks up. My system works otherwise perfectly, also when using the same server in Telnet mode via terminal software.

This new CAB looks VERY promising... Very. But (sigh..) how to get it to work somewhat reliably..? =-(

Good work, guys, anyway. I look forward to what will come up next!

Greetings,
TH

3494. Positive image better demo ?

Actually, I think I should explain this one. I put this under the "it would be nice", since, from a non-programmer standpoint, it would probably take a lot of extra programming to support the mailto.

I've no idea if mailto is part of any official html specs, but it seems to be everywhere; even lynx supports it.

We would probably need an mail.inf file containing the POP/SMTP mail username, password, real name, organization, and perhaps reply-to address. Then SMTP port 25 would have to be implimented. I know SMTP protocol is very simple and very well documented, but what about POP?

Hell, if I was more programmingly inclined, I would try to take a whack at it myself...

3497. Perplexing Stik & Slirp problem

Newsgroup: comp.sys.atari.st
Date: 1995-12-10 00:00:00 UTC
From: smselick@ios.com
Message-ID: <4af0fd$8c9@news.ios.com>
Source record: 154754

Hello all!

I have an interesting problem with Stik. I was using the 108 version with my internet provider under slirp (a slip emulator that runs under a shell account) just fine. This was a Sun machine. Unfortunately, the service provider does not allow such slip emulators, and I got a nastygram from them saying that they'd kill my account if I kept using it.

Now enters my new job. I am now a local phone call away from my job, and I have access to a modem hooked up to an HP unix machine. I downloaded a precompiled copy of slirp, and started it up. I can use MintNet and X just fine, but Stik doesn't work. I get stopped on the "resolving Host" window, and I never get a response from the Unix host. I checked again, and if I just change the DNS server back to my internet service provider, I can talk to it. I can even telnet to my serice provider and start slirp there and it works fine! But, I can't do this for any extended period of time, or they will axe my account.

Any suggestions?

-Steve

>I think the c-version works i mono, or doesn't it Johan?

Hmm, perhaps it really does. I'll have to check the sources...

[some time later]
I cut out the display code from some of the MGIFv5 sources, where it was
only used for colour display. For monochrome MGIFv5 uses another routine.

If I hadn't removed anything, the colour display sources would've fallen
back on some rather general C code if the display mode was not 16 or 256
colours. That would most likely have worked in monochrome, but it would've
looked very bad.

Unfortunately, it seems I decided to cut away parts of the general routine
in DVIEW. The C code in there treats everything as a 16 colour mode.
Since the code advances its screen pointer according to the number of
bitplanes in use, it might produce something useful, though.

I'll see if I can put together a DVIEW version with an ordered dither
display routine for monochrome mode. I don't know when I'll get around to
it, but it'll probably be before Christmas.

: but 1.07 seemed to work a little better that way. How is it? Can CAB handle
: fast modems, MNP, etc. at all?

According to the FAQ, "runtime error" is a well-known bug that's being
worked on. As for total system lockups, I haven't really had any. Mostly
when my system fails to resolve a host, it's a problem on the local net
(such as the nameserver being down), or the remote host being down. There
is not much configuration needed by STiK, outside of nameserver and
gateway(?), so a good chance that any errors like this are out of your
hands.

: Those runtime-errors prevent at least me for using CAB at all. As STIK stays
: fully functioning after the crashes (I use Geneva r 004 & Falcon), and the
: browser seems stable, too - could the problem be inside the .OVL -part of
: the program?

Yup. Read the docs; the OVL is the hook between CAB and STiK.

I run a Falcon under plain TOS, and very few patches; hell, even sometimes
I don't load HSMOD06. Either way, highspeed connects work just fine and
dandy for me.

When a runtime error occurs, simply press the return key to get back
to the desktop, and re-start CAB. Most of the time, the failed URL
will load happyily the second time around.

: I also wonder, why CAB doesn't find most URLs; it can load about 6000 bytes,
: for example, and then bang - down it goes, or locks up. My system works
: otherwise perfectly, also when using the same server in Telnet mode via
: terminal software.

Again, the problems are within the CAB.OVL file. It's in the docs,
a well known problem, and I wouldn't doubt the author is pulling his
hair out trying to resolve the problem.

Outside of this one bug, CAB is a really wonderful product. The
improvements between WWW108 and WWW115 are tremendous: support for
forms, tables and backgrounds, as well as other features. It's
simply a matter of time. Of course, as with all software products,
there are always hidden bugs, or a list of improvements that the
author has. And us in c.s.a.st are adding our voices to the improvements.
Given that STiK/CAB has only been available for several months, I think

the improvements are moving along at light-speed. Probably by late 1996, CAB will be as fully-featured as some of the bigger guns.

CAB is a browser that was written from scratch to take advantage of GEM. It's not a port of any existing browser, which has it's own bug list, but one we can call our very own. All I can say, is my check is in the mail :-)

Hi

In my Auto folder I have a program called FONTLD.PRG 2679 Bytes
and NEODESK.FNT 7680 Bytes

These where installed with the Hard Drive, I neither have or
want NVDI or anything like it, but wouldent mind a different font
apart from this one and the gem system font, not a choice, just
one to replace the one I have which is a tall thin font,

So the question is, does anyone know of any other fonts or where
I can aquire them,

Many thanks.....!ynoT stosser@airtime.co.uk

I have an opportunity to but one cheap...anyone know if this'll be
worth the bother?(assuming it still works) Can I still get toner etc?
-scanner also included too.
I believe it belonged to a small print firm and *was* all working some
time ago........

Any comments gratefully received!
Simon.

3505. Help w/TAF web browser? Please?!

Newsgroup: comp.sys.atari.st
Date: 1995-12-10 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <R9FmEla.johnhechtman@delphi.com>
Source record: 154762

This is a long post, so if you don't care about the TAF web browser and getting it working, please skip it. It started as a letter to Stephen Christian, who I was told is the best advice person in TAF for folks like me who are having trouble getting the browser working. Unfortunately, it seems that Stephen's email isn't going through, or he's out of town or? I've sent two copies of this letter to him and gotten no reply. Howard Carson's Genie address is no longer working, so I'm posting this to as many places as I can, to try and get help from _someone_ who knows how to get the package working. Thanks in advance to all who help!

12/4/95

Dear Stephen,

I was advised to write to you for help in working with the TAF/MiNT/WWW distribution. I d/l the 7 disks from Delphi and was able to get the MiNT/UNIX/X-windows environment up and running. This was kinda gnarly in itself, as there are several pitfalls for the potential user in the setup. Nowhere in the kit does it state that if you d/l the files, you need to put them on floppies so that the install program will know where to look for them - yet this is how the setup _has_ to be installed.

The instructions for loading mint.prg and _then_ setting up a boot program are an invitation to a harddrive lockout, as it takes a few tries (at least for me) to get Superboot to work correctly, that means a few re-boots and if mint.prg is enabled in your auto folder, you'll then boot into MiNT with no way to avoid it unless you bypass the hard drive!

I was a little smarter and set up Superboot _first_ thus avoiding that whole scenario, but it's a real pitfall for the less knowledgeable TOS user. Please understand that I'm not complaining, just pointing out potential problems for other users. Feel free to exerpt anything I write for use in your future instructions on the TAF package. :)

So now I have X-Windows up, I've learned the vi editor enough to not do damage with it and I've edited my chatfile (for login), my resolve.conf (for domain and nameserver) and I've set the options file for 19200 baud as I have a 14400 Boca modem and am using the hsmoda06 patch program, which for some reason does not recognize 14400, but can be set for 19200 and then be pulled down by the modem. My problem is that I'm not sure I have the syntax right on the chatfile and I'm going nuts trying to use the vi editor and searching all the MiNT/UNIX docs for an explicit setup routine for the chatfile! :(:(My basic problem is that I can log in, but after that I can't do anything! Chimera/FTP/Telnet all don't work yet.

I bought the Unix for Dummies book and it seem that many of the commands are not implemented in the included versions of programs. For example, neither the "fp" nor "fpr" (send to printer) seem to work and it's very hard to study docs unless you can print them out. Or is there a different print command for X-W? The "grep" command also does not work which makes it hard to search - I haven't tried to do a "find" yet - hey I don't really know UNIX - but a list of the common UNIX/X-Windows commands included in the docs would have saved me the cost of a $22 book and would have taken two pages at most. And now it seems I need to go get a book on X-Windows as the commands are different from regular UNIX.

Below are my current versions of the chatfile, resolv.conf and all the other files needed to configure the TAF package, along with a sample login to my IP provider. I've verified that the hostname and domain name are correct. If I could find some way to send the syslogd output to a file or to my printer, I could then include the screen prompts I get when trying to log in. I've gotten the chatfile to dial in, but I'm not sure if my syntax is correct to have it give my password. If you could help me complete my TAF/WWW setup, I would be a very grateful Atari user!

Delete CAB.RSC from the main directory, then, in the RSC directory, rename CAB_E.RSC to CAB.RSC and copy it into the same directory as CAB.PRG.

Works well, and considering it's on an 8Mhz machine, works very fast too! I look forward to the full Internet Package (Which I will _need_ in just under a year unless I want to fork out lotsa money for a new computer :)

It will cope with any speed of RAM from 150ns up to about 70ns, but won't
actually access it much quicker than 150ns.

The ST will read either Parity or Non-Parity RAM, but mixing the two
does cause problems from what I've seen (programs who have their data
spread across the two types frequently crash).

Without doing strange things to the system, the most physical memory the
machine will hold, is 4Meg. (4x 1meg SIMMs). I have heard of people with
12meg in their system, but they have modified the MMU to cope with it.
I'm pretty sure there are people out there with even more than that.

The SIMMs in my ST, came straight out of an old 386. Just 4 standard
1meg, 30-pin SIMMs. I have no idea what speed they are, but I guess about
90ns. (ns = nano-seconds).

The layout on the Board is like this:

---------back of machine--------

BANK 0 - 1meg------\
/-----BANK 1 - 1meg 2meg
2meg BANK 0 - 1meg------/
\-----BANK 1 - 1meg

So, if you stick 1meg in both Bank-0 slots, you'll end up with 2meg.
There must be 2 SIMMs in Bank-0 for the machine to operate. And all 4

slots must be full to get maximum memory (It won't work with say, only 3 slots used).

Standard Configuration is for both Bank-0 slots to have a 512Kb SIMM in them, making the machines 1meg units. Anyone who uses it for anything decent, promptly throws them out and slaps 4 1meg SIMMs in :)

Basically, if the SIMMs fit (i.e., right # of pins), and there are all 1meg, and not _too_ fast (60ns or better), and all the same parity (non-parity or parity), then chances are, they'll work. ST's aren't terribly fussy machines.

Note: You'll have to use an STe or better for this - earlier machines use chips, not SIMMs. But, if you're using it for sequencing, then the DMA sound and RCA outputs will undoubtably prove useful on the STE.

Expect to pay no more than $50 for a 1meg SIMM. Any more than that is too expensive. With a bit of work, you can probably find a set of 4 1meg SIMMs for next to nothing, as 4meg in a PC just isn't enough now with the advent of Windows '95(meg large), and other such poorly-optimised programs. If you can find an old machine with 4 such SIMMs in it, stick them into the ST and see if it goes, if it doesn't, just take 'em out - just be careful, the standard SIMM sockects aren't very tough, I've had mine upgrade to ultra tough ones with gold contacts when a pin busted in one of them :) Didn't pay full price of course... (Such is the New Zealand way..... whenever possible, you can find a mate who is perfectly happy to do the job for a few beers or certainly a lot cheaper :)

>could you please tell me which ones work best and what kind of speed gains
>it has over finder based applications.
>Thank You
>

I use MagiCMac with a 7100/80 (at 86 MHz)
Many applications works. Few games, but GEM applications work well.
Calamus, Gemview, Script, Phoenix, Da's Picture, Everest, Kobold, Two in
One with ZIP, LZH, ARC, ZOO...
I didn't try Papyrus but I thik it works. I don't remember, but I think
that Da's Layout works.
And many others...

And now a NVDI driver can use the Mac printer driver. A Calamus driver uses
NVDI driver.
So, now, it's possible to print with Calamus under MagiCMac.

: Funny you should mention Netscape. I'm at work right now. Got a
: problem with Netscape? Call me! <GRIN>

Well, I had had to use it as a testing tool when first composing the YAC pages last year, as there wasn't CAB. Now I am going to start composing them with CAB in mind. Hopefully they'll still look good under Netscape (I'll give them a peak when I get a chance).

I figured out that the problem seems to have been caused by my use of a GIF with a transparent color (I did that so most of the wallpaper would be whatever color any browser would want it to be, so browsers running under 16 colors wouldn't dither it). I changed to a standard GIF and the YAC page is beautifull again. I even added a simple table, just 'cuz I could now. My ISP should put it on-line tomorrow. Give it a try, if it comes up mostly black and unreadable except for the links, (under CAB) then its still the old one, try again the next day.

azog (azog@gti.gti.net) wrote:
: A question of CAB's cache. Is this a "checked" cache? Like in Netscape,

I don't think this is a checked cache. You'll have to hit the "Reload"
button to make sure you have an up-to-date page I think. This
"checked cache" would be a good addition to your wish list.

: I wonder if the author(s) read this newsgroup?

Well, he did respond to some messages a few days ago, so I guess he
does. That's why I started listed bugs and wishes inan earlier thread.

: I do a lot of comparisions to Netscape... It's not a fair comparision, but
: not far off the mark.

In some ways it is not a fair comparison, after all Netscape is written
by a bunch of programmers, all paid well enough to devote full time to
the project (I assume). In other ways it is a fair comparison, I think.
Tim, Steve, and expecially Alexander have given us a program colse enough
to Netscape 1.2 that comparisons occur naturally.

: I don't know if they're part of HTML 2.0 or HTML 3.0, but Netscape (and
: others) have a "visited link" option, that lets me set different colours
: for links that I've already been to.

I agree, this would be a nice feature and shouldn't be too difficult to
do. The browser has to check the cache file to see if the link has been
visited recenly and then just diplays the link in magenta instead of blue
if it has (or whatever colors you chose in the "Options" dialogue).

: Finally, this is two in one: a timeout feature. There's been times that
: I selected a link, and the host is unreachable, or something happens that
: I can't connect to it. A 60 second timeout would be nice. Related to this
: is a "stop" button, or similar. Sometimes people have links to hosts that
: are down or something, and a stop button is handy. When I press the stop
: button in Netscape, it seems to continue loading local page.

Actually, both of these already exist. I don't know how long the
time-out is, but I have seen it happen. CAB just gave up downloading two
fo the inline GIFs on a page I was trying to get, and then displayed the
page with two gray boxes where the missing GIFs should have been (they
may have been interlaced GIFs that CAB got enough of to know how big they
should be). There is also the equivalent of the STOP button on
Netscape. It is the ESCAPE key on your keyboard. Helpfully it onlly
aborts the piece of the page it was downloading, and goes on to download
the rest of the page, unless you toggle it to the point there is nothing
else to download and then displays however much it got before you hit the

escape key. STiK gloms so much processor time on my Geneva box, a mouse click wouldn't be read in time to do any good. But I would appreciate two keys being read, one for the latest data and one for the whole page, you know, just stop loading NOW.

: {other wish list times deleted by E.Hays}

Alexander already mentioned support for printing, and I highly agree. GDOS is already being used to display to screen, shouldn't it be just a hop a skip and a jump to get it to send the data to the printer?

Also, I would like to see support for the clipboard included. I hate having to type URL's in over and over again, all the way from http:// to the very last character. I love being able to copy them off pages and out of e-mail and paste them in the "Goto" line. I also like being able to cut text off a Web page and quote it in mail or an article I'm writing. Here would be an opportunity to one-up Netscape which only allows highlighting one screenfull of text (drag-highlighting text doesn't cause the window to scroll). And who hasn't visited someones Web page and decided to see what lurked one folder up? But with the current address displayed in the info line, there is no way to put the cursor at the right end of it, hit the backspace key a few time, press [return], and have a look see.

Inline JPEG's would be great. That could be a major chore though.

What else... well, you mentioned support of mail, then add of course ftp and gopher too.

Well, its a lot. I don't want anyone to feel overwhelmed by the list. So much has been accomplished already I just want to sit here and thank them all over and over again. But these features would be _so_ useful. And some of them seem so simple...

Don't sound so surprised Roger! It's quite right - my brother uses one occasionally too.

Quite pricey, though and results are hardly what you'd call ideal due to the way a guitar plays. The alternative of using a MIDI guitar isn't as flexible as using a MIDI compatible keyboard, which explains why he's working hard at piano lessons atm and has bought a MIDI keyboard that he outputs via his Sound Canvas.

He uses a Shadow MIDI pickup on his acoustic guitars which was probably around the 300ukp mark new, although he got it second hand. Try one of the shops in Denmark Street in London and they'll more than likely have something you can look at.

520's have half a meg (512Kb) of RAM.
1040's have one meg (1024Kb) of RAM.

That's basically the only difference. If you're going to get one, get a
1040STE. They're less prone to problems, and are nicer to use.

: WWW115.ZIP, the cache settings for the Hard Drive (on the right when you
: select Cache... from the menu) are set so that 10MB are reserved, but 10MB are
: kept free. Consequently as soon as you try to access anything you get
: an error message - something like unable to read file 0000001 - because the
: HD cache limit has been reached. Try setting for example 10MB reserved and 1MB
: to be kept free - this solved the problem for me.

One of the first things I did was to go through the Options menu and
reset everything to similar values to what I had running (successfully)
with WWW108. I have adjusted the values of "Reserved" and "Keep Free"
to 100 and 10 Mb respectivly.

I only tonight got somewhere when I reinstalled the HSMODEM auto folder
programs DRVIN and MFP. All at once, I was able to access URLs. But
CAB.APP crashed whenever I tried to access any page larger than 25600 bytes.

The other problem of accessing folders on my hard disk through the home
page links still is there -- I can only get as far as the root directory.

Comments? Questions?

3524. FS: Atari Falcon and assorted bits (UK)

Newsgroup: comp.sys.atari.st
Date: 1995-12-10 00:00:00 UTC
From: Jim Twynam <jim@jimt.demon.co.uk>
Message-ID: <30CB0431.3BDB@jimt.demon.co.uk>
Source record: 154781

Having just jumped headlong into the PC computer world,(I got a P100
with windoze 95... No Flames please!!), my Atari system and all its bits
are up for sale.
Since I live in the UK (Hemel Hempstead) I'm accepting offers from UK
residents only.
Anyway, here's whats on offer :

1.
Atari Falcon 030,68882 32MHz FPU,4MB RAM, 65MB Internal HD
14" Multi-Sync Monitor
Blow-Up Hard-1 Screen Driver
(Default boot Res 1024x768x16colour) Non Interlaced
(800x600x256colour) Non Interlaced

The Following are to be bundled with the above.
Llamazap (Falcon Game by Jeff Minter)
Atari Jaguar Powerpad
Naksha Mouse
Panasonic 9-pin Printer KXP1180

All of the items above are for sale as a package deal, none of
these are on offer alone. Bidding starts at 600.00 Pounds Sterling.

Other Items for sale.

2.
External 1GB SCSI Hard Drive, this comprises of an enclosure
with PSU, Fan, 2xSCSI-1 Ports, External ID selector and Power switch.
A Seagate ST11200N 1.02GB 3.5" drive is fitted internally.
This item will be supplied with a Falcon SCSI Cable or SCSI-1 to SCSI-1
(By SCSI-1 I mean the large 50-way Centronics type connector.)
300.00 Pounds Sterling.

3.
ICD AdSCSI+ Adapter, was a leftover from my original Atari-ST setup.
It may be used with the drive above to connect to any Atari-ST(e),
although you will need to remove the external SCSI connectors from the
disk box.
40.00 Pounds Sterling

4.
Atari ST Games software and Utilities.
Not for sale individually, All are in Original Packaging.
F19 Stealth Fighter, F29 Retaliator, F-16 Combat Pilot,
Supremacy, Conflict Europe, Wolfpack, Lemmings 2,
Elite II Frontier, Oids, Warhead, Misslie Command.

35.00 Pounds Sterling.

5.
Lattice C V5.6
Devpac 3 680x0 Assembler
Devpac DSP 56001 Assembler
(All of the above packages are with their original packaging,
including all manuals)
100.00 Pounds Sterling.

6.
Programming Reference books.
Atari Compendium Programmers reference book.
The Concise Atari ST 68000 Programmers Reference Guide.
Motorola 32-Bit CPU's Programmers Reference Manual.
Motorola DSP56001 User's Manual
Motorola MC68030 Enhanced 32-Bit Microprocessor User's Manual
30.00 Pounds Sterling.

All Replys via Email please

Thanks. :)

3529. More FPU questions

Newsgroup: comp.sys.atari.st
Date: 1995-12-10 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <818612468_OASIS_@phil4.demon.co.uk>
Source record: 154786

Having fitted a 68882 FPU to my mega STE, and tried running versions of a couple of programs, compiled to run with it, they crashed (11 bombs). This was quite worrying. I downloaded LFED (LineF emulator) and ran it before the progams, and then they run without crashing.

Is this the right thing to do, is the FPU doing the processing of the Float Maths, or the LFED program ??? Why do the programs crash without it ??? Why wasn't I told about the need for the program when I bought the FPU and PAL IC ????

Thanks for your Help !

3530. Converting ST disks to PC/Reading ST disks _on_ PC - The FAQ!

Newsgroup: comp.sys.atari.st
Date: 1995-12-10 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DJCwJq.Jn9@actrix.gen.nz>
Source record: 154787

Okay - here's a slightly more informative version :)

The ST to PC disk-dilemma FAQ
(Or - "How do I read my Atari disks on my DOS machine?")

v0.9

By Steve Wells - steve_w@atlantis.actrix.gen.nz

This FAQ attempts to explain, how you can make the data on your Atari-ST (or compatible) diskettes, readable by a PC, or indeed, and machine that is capable of reading PC disks (More modern Mac's, Unix boxes etc.). I've tried to explain all problems involved, but this FAQ still has some holes in it, and some information may just be plain wrong. I'd appreciate any extra information, and constructive criticism and corrections are welcomed.

The simplest way to make a disk accessable by both the ST and the MS-DOS machine, is to format a 720Kb disk on the PC. This is done by taking a 720Kb disk, or a High-Density one and sticking tape over the HD-detect hole (which is the one without the sliding bit behind it), as many PC's refuse to format HD disks in 720Kb mode. Just use a disk you'd normally find on your ST, and you'll be fine (although, with PC's unfortunately becoming the "standard", 720Kb disks are getting harder to find, so, although this trick is considered by many to be a bit dodgy, due to some of the differences between the makeup of the DD and HD disks, it's becoming the only way. Most people don't have any problems using HD disks as DD ones, but some drives don't generate enough electrical-charge to work with the HD disks, which may prevent them from working properly with them. Judging from the relatively small number of complaints about this though, these drives are pretty rare, (probably only quite old ones)).

Put the disk into the PC.

Type

FORMAT A: /F:720

This will format the disk to 9-sectors per track, 80-tracks (00-79), and 2-sides. Giving you near enough 720Kb.

This disk will now be readable on both PC's and ST's.

Or, you can format a disk on the ST. If you have at least TOS 1.4 installed, (later model Mega-ST's, and any machine from an STE upwards), then the computer will format disks to be PC-readable. Machines before this use a slightly different method which most PC's don't understand.

Note: Maybe 1% of ST's out there still have single-sided drives, so if the ST you are going to be using does, then make sure you format disks single-sided. Do do this on the PC requires: FORMAT A: /S:1 /F:360 but as no-one in their right mind ever uses this - I'm not 100% sure of this command.

All you have to do for this, is put a blank disk in the drive, an select "Format Disk" from the "Desk" menu. Select "Double Sided" and "OK". Now wait. Not _all_ PC's will read disks formatted this way, the only way to find out if yours will is to try. Probably the simplest way is to track down "DC-Format" by Double Click software, which is available on most of the major Atari supporting FTP sites. The filename to look for should be DCFMT30.ARC. On atari.archive.umich.edu it's in atari/Utilities/Dc/ and on ftp.cnam.fr it's in pub/atari/Utilities/Dc/. It should be on most other archives in the utilities directory.

To format a PC disk with this program requires the settings to be:

Sides: 2 Format Type: Normal # of Tracks: 80
Sectors Per Track: 9

Most PC's won't read disks with "Skewed" or "Twisted" sector formats, so don't format them with this option unless you know your machine will read them - the PC's I've tried this with work _slower_ with this format anyway, other than the ~50% increase obtained by using it on the ST.

Format the disk with these options, then select "MS-DOS Bootsector", and write a DOS compatible bootsector to the disk.

This way almost never fails. But those PC's are fussy machines, so it's usually best to use the first method and just format the disk on the PC it's going to be read by.

---------- Converting the data

You hardly need to touch most of it. GIF's are viewable by pretty much any viewer on the PC (CShow) and ST (Speed of lite). MOD Files aren't - there's about 10 different "standard" for MOD files now, and only a couple of them are usable on the ST. Scream-Tracker files, MED files, most Octalyser files and others, just aren't supported on the ST. Although, there are programs for the Falcon-030 that will play many of the new formats.

Text files are used by the same format. Just make sure you save your files out "As ASCII" or you'll have to work around conversion patterns. A well supported method is to save your files as .RTF (Richtext Format), which is loadable on most PC (Windows) word-processors, and a few on the ST. There are also convertors on the ST to change many PC formats into ones readble on the ST. Other platforms (Mac, Unix etc.) do use slightly different methods, so you may have to dig up a conversion utility to keep them happy - look for "Blinex" for the ST which will do this for you.)

So, in a nutshell, the simplest way to transfer data using 3.5-inch diskettes, is to format it on the PC, and from there anything on it can be read by either machine.

Notes:

o Some DD drives (very rare) will not generate sufficient electrical charge to work 100% with HD (1.44Meg+) disks. If you find using HD disks on your ST results in lots of disk errors, try cleaning the drive heads (cleaning disks can be obtained from virtually any computer store), and if still they cause trouble, you may want to try and locate some standard DD (720Kb) disks.

o There are some combinations of platforms and formats that will render text files incomprehensible. There are programs for all platforms that will deal with the vast majority of such problems. The best one I have seen for the ST is "Blinex" which will strip "illegal" characters from text files, and write them in their correct ST-compatible text formats. It will also write files in PC/Mac/Unix formats. It also has some other handy functions which make Blinex an invaluable tool if you do a lot of text-file manipulation. Blinex should be available at all good Atari supporting FTP sites in the Printing or Utility directories.

o Some early Atari machines, and extremely rare more recent ones, have problems with their disk-detect mechanism. This can result in the computer not realising that the disk has been changed. The problem with this and PC disks is that, most versions of MS-DOS write the same serial number to the disks, and the serial number is what TOS uses to see if the current disk is the same as the previously accessed one or not. If the serial numbers of 2 disks are the same, and the drive doesn't notice they've been changed, then TOS will often happily continue thinking that the new disk is the exact same disk as the first one. This can result in corrupted data, lost files, and ruined disks.

There are a couple of ways to fix this problem. The most obvious, but least practical, is to get a newer disk-drive without this problem. Another, is to find a program called "FMC" (Force Media Change), which forces TOS to do a complete re-read of all FAT and directory information when a new disk is inserted, this reduces, but not removes the problem. Lastly, the best method, is to format disks to be PC compatible without actually writing a PC-specific boot sector to them. There are several programs that do this. M-Disk is one such program, and most decent formatters will also manage this task. This means simply that the bootsector will contain an original serial number, rather than one that translates to "3.3" (MS-DOS v3.3) or some such thing. There are also programs available that will randomly select, and write a new serial number to the disk. "V-Killer" (A Virus Killer) will enable you to change this, and there are many other programs that will also manage this.

These programs were all found in atari/Diskutils/ on atari.archive.umich.edu or one of its mirrors, or the easier to get into

ftp.cnam.fr (pub/atari/Diskutils)

Useful programs:

SERIAL.ZOO Randomly allocates a serial number to the disk, DOS
doesn't really care, but it saves your ST some confusion.
UNEEKIT.ZOO Similar to the above.
PCFORMAT.LZH As it says, a program specifically to format disks on
your Atari that will be readable by a PC.

MS-DOS Programs:

ST2DOS10.ZIP Will modify some disks to make them readable on the PC.
ATARIDSK.ZIP Will let a PC read disks formatted using TOS 1.2.0

o Even with everything done correctly. Some PC's may still not read
your disks. This will most likely be caused by one, or both of the
machines having mis-aligned drive heads. An often effective solution is
to simply clean the heads using a "cleaning disk" you should be able to
get from most computer or stationary stores. If this still doesn't
work, then you may have to get the heads on your disk-drive re-aligned.
This is a routine that goes beyond the realms of the FAQ, and should
really be consigned to someone who knows how to do it - if done
incorrectly, it _can_ wreck your drive, or at least, worsen the
compatibility. If done correctly, it can make disks more reliable, and
often speed things up. At least try and clean your drive heads every
couple of months, or more often if you use them a lot!

----- Fin.

Suggestions/Corrections/Additions/Deletions etc.!?

Good point.

>I don't know if they're part of HTML 2.0 or HTML 3.0, but Netscape (and
>others) have a "visited link" option, that lets me set different colours
>for links that I've already been to. (there are also other link tags,
>like alink, vlink, and at least one other).

That would include keeping a database of all visited links which Cab doesn't
do as of now. I'm not sure how useful this is either.

>Finally, this is two in one: a timeout feature. There's been times that
>I selected a link, and the host is unreachable, or something happens that

>button in Netscape, it seems to continue loading local page.

It does timeout. (After 120 seconds, I believe.) If not, hitting escape
should do the trick (although I'm not sure if that stops an attempt to
resolve a hostname).

>Java! (not extremely unreasonable: Sun has opened Java up for development,

You can get it directly from ftp.ardi.com.

By the way has anyone had any sucess on getting MagicMac to work under
Executor, the Macintosh emulator for DOS. Could this be yet another way to
emulate an ST on an IBM-PC.

Any comments welcomed.

Hi,

I've decided to sell my 6 month old Falcon030. Unit is still under the 1
year warranty. The unit is unmodified.

Falcon030 :

68030 CPU 16mhz
4 meg RAM
65 meg internal IDE hard drive
Mouse
2 Video adapters : 1 for Atari monitors and 1 for (S)VGA
All manuals and diskettes that originally came with the unit.
MultiTOS, Atari Works, SpeedoGDOS, Breakout, Landmine....
Original Box and packaging

Asking $700 or best offer.
Please E-mail me or call 216-729-0761 eves 7:00 - 10:00

3537. Downloading Problem

Newsgroup: comp.sys.atari.st
Date: 1995-12-11 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.91.951211201854.472B-100000@moose.erie.net>
Source record: 154604

I've been having a strange problem ever since I changed the hard drive in Mega STe from the standard 50 meg Seagate ST157N to a 420 Meg Seagate ST1480N.

Here'a a summary of my system:

Computer: Mega STe, 720K floppy, no math co-processor
OS: TOS 2.05
HD Booter: ICD PRo 6.5.5, read cache, write verify, no write cache
HD: 420 Meg Seagate ST1480N, 11 partitions, 10 32 Meg GEMDos,
1 64 Meg BGM, 1 64 Meg OOP (Spectre)
AUTO Programs: AMCGDOS, BIGCOOKY, DCLITOFF,DIAB630, DMIRROR, DRVIN,
LEDPANEL, MACCEL3, MFP, OVFIX1, PINHEAD, SCC, SPEED,
SUPRVIEW, UIS_III (alphabetical order, not load sequence)
ACCS: MULTDESK, XCONTROL (1.31)
Modem: Prometheus 14.4K v.32 connected to Serial 2 at 19200 bps
Term Program: STorm 1.02 (have also tried Connect 2.45 demo)

I have used this system with the original Seagate ST157N for downloading software through my dial-up Internet server regularly and reliably for over 2 years. When I installed the ST1480N I started getting "Write Fail" indications during Zmodem file downloads. These occur ONLY during downloads. I've NEVER had a "Write Fail" reported during disk operations from the desktop or the Universal Item Selector. I tried the Connect 2.45 terminal program since it has different Zmodem routines than STorm and got the same results. I checked the loading order of my AUTO programs and confirmed that it is the same as it was before changing drives.

I have finally pinpointed the problem as being related to the MODEM.CPX. If the MODEM.CPX is active I get the "Write Fail" problem. If it's not, I don't. I have tried two different MODEM.CPX files (one 6370 bytes, the other 7093 bytes) with the same result. The MODEM.CPX file does not have to be RAM resident or even loaded to cause the problem.

Fortunately, I can survive without the MODEM.CPX since I can set the ports from the terminal program. But I'm baffled as to how the MODEM.CPX can cause "Write Fail" errors when writing to the hard disk and also why this problem cropped up when I changed the hard disk.

Comments, suggestions and explanations would be appreciated!

If you think you're an Atari computer expert, consider this a challenge to your credentials! :)

it?

I'm sure this will be possible. You need to compare the specs. of DBmaster with the db you are using on the PC (Paradox?). You will usually find that they will have "comma-separated" file formats in common for "export" and "import".

Hello Hallvard,

there is exactly the tool you need: it is GNU recode.
It's source code (for your Sparc or a decent atari development
environment) is available at the numerous gnu mirrors.

There is also a compiled atari version, but I think it is
compiled to use MiNT, but I don't know for sure.

If you need the ST version, try ftp.rz.tu-harburg.de
they have a directory ATARI beneath root!
/ATARI/gnu/gnu-utils could be the path, try it, enjoy it!

Ciao,

3544. Some Basic Falcon Questions

Newsgroup: comp.sys.atari.st
Date: 1995-12-11 00:00:00 UTC
From: dhbutler@stat.mps.ohio-state.edu
Message-ID: <4aiblh$a3f@osustat.mps.ohio-state.edu>
Source record: 154658

OK, I finally got a Falcon (C-Labs MK I with 14mb ram) , and I have a couple basic questions that I have been unable to easily find answers for. I would appreciate any help you can give me;

1) I need to contact ISD marketing in North America, but the phone number in my Calamus SL manual is no longer in service. Anyone have the new number? (OK, that's not a Falcon question, you might have noticed...)

2) Is there any way to get a VGA monitor to 'emulate' the Atari RGB color monitor? It seems that many demos and a lot of nice little utilities only run on the RGB monitor. (This boggles my mind - I'm fairly sure that most Falcon users are using VGA, aren't we?)

3) Is there any way to get Calamus 1.09 and the older Outline Art to run on the Falcon? I have SL, but I prefer to use 1.09 to do my B&W work since it is so much faster...

4) I need a 600dpi driver for Calamus/Calamus SL (for a HP 5mp). Do I have to go to ISD for this or are there some drivers I can download?

5) Finally, I have a feeling that a number of problems may be due to NVDI 3.x which I purchased along with the Falcon. I'm interested in *compatibility* more than I am in speed (I use Geneva instead of Magic for this very reason) - Would Warp 9 work better for me? The version included with my T25 on my Mega ST system does not work on the Falcon, so I would have to pay for an upgrade, but if it is more compatible than NVDI it might suit me to do so...

6) If any kind soul out there could point me in the direction of the 'standard' set of patches I should have installed, it would be great.

7) Finally, I have a RENO external SCSI II CDROM drive which I use on my PowerBook. I have the ICD Pro drivers which I am currently using. There should be no problem hooking up my CDROM, correct?

Thanks for the help... The transition from my ST to the Falcon is proving to be harder than I thought - an amazing amount of software has failed even though my Mega 4 was equipped with TOS 1.4, an ISAC high-rez color board, a T25 accelerator and Geneva/NeoDesk.

>accept, but Atari hase become a small to middle size company that -even
>if it wanted to compete- couldn't do so. To much of trust has been lost;
>the dropping of the computer line was a major error, such as the decision
>to leave Continental Europe where they had the biggest market share.

I agree with you that dropping the computer line might have been a major error. What's ironic is that Atari claimed that the PC world was too competitive (which is true) and so they wanted to compete in an area in which they felt they could do well. But they didn't count on Sony jumping into the fray. In reality, the video game industry is just as competitive as the PC industry that they left! Sony, Sega, and Nintendo are just too powerful.

I wished Atari was able to stay in the computer industry and improved the ST line so that they would be better game machines. That's the reason why I bought the Mega ST in the first place -- it had better graphics and sound than most PCs. But Atari just let them fall too much behind the PC. Now that I have a 486 PC, I find that what I mostly do with it is play games and access the internet.

Atari seems like it's constantly retreating. They retreated from the computer industry to go back to video games. Now, there's talk that they'll retreat from that and go to PC software. I just wish they'll make a stand and go all out....

3550. Real Time Sound Processor for STe ?

Newsgroup: comp.sys.atari.st
Date: 1995-12-11 00:00:00 UTC
From: Karl Hodge <hodgek@ehche.ac.uk>
Message-ID: <30CC9179.45AB@ehche.ac.uk>
Source record: 154664

Replay 4 from Microdeal used to come with a real-time sound processor,
that enabled you to turn your ST into an effects unit, adding distortion,
reverb or echo to a direct line source (through the cartridge port).
This was incorporated fully into release 8 of the sampling software.

Does anyone know of a similar, standalone program in the public domain
that acheives the same thing, preferably STe specific ?

Source record: 154665

My brother has the following Atari ST stuff for sale in Palisades Park, NJ. All prices do not enclude shipping.

Atari 1040ST one meg ram, built in floppy drive, may ro may not include the tos 2.06 upgrade (I forget whether he got it working - Otherwise it will have Tos 1.4) $100

SM-124 Mono Monitor $75

SC-1224 Color Monitor $75

Spectre GCR $100

NEC CD-36 CD-Rom drive. External SCSI drive with built in terminator. Single Speed, works great with Extendos and ICD Link/2 (not included) $50

Home-Grown hard drive system including 2 ~150 meg MFM hard drives, Adaptek 4000 MFM -> SCSI converter, Supra Atari SCSI host adaptor with built in clock, and a sturdy wooden case. This is a 300+ meg hard drive system all ready to go! $200

PC-Ditto 2 board free with any above purchase - especially the computer :) or $20 by itself.

E-mail <smselick@ios.com> or call Steve Selick at 201-484-5029

Message-ID: <818674657snz@mbha.demon.co.uk>
Source record: 154666

Greetings all...

Here are some bits and pieces for sale:

1. EOS (enhanced TOS 1.4) ROMS - 6 chip set. Very fast and
some additional gadgets (window cycle) etc. Most of the
TOS 1.4 bugs patched/rewritten. Great. Not being used now
since I solde the Mega4 and now have a TT. Offers?

2. Phonix 96/24 modem. 9600 baud fax (Sierra) Works great with
Tele-Office/Office Jnr. 2400 baud normal comms :-(. Still,
could be a very cheap way to kit yourself up with fax since
Office Jnr is now shareware and in English! Not being used
now since I use a work modem. Offers?

3. Matrix Coco colour card. Great. 2/16/256 colours. Up to
1024x768 (16 cols), 800x608 (256 cols). Gives great virtual
screen for use with DTP (Pagestream works great with full size
A4 page scrolling! Very compatible. Looking for UKP 170+.
Comes with NVDI 2.5 (special version).

All in good working order. Get in quick.

I just downloaded it today. I think I finally got it working though
I'm not very impressed (it seems very "locked", not letting you put it
anywhere you want if you have a harddisk, but I finally figured out
how to do it).
This version seems to be an "unofficial" version- the one Danny (of
Hensa) was supposed to translate as an "official" version has
apparenly been delayed.

Anyway, the unofficial version is available at: micros.hensa.ac.uk

micros/atari/tosp/p173/jroff34e.zip (Jroffice 3.4E fax)

And it takes 269K compressed.

If you have as much trouble as I did setting it up, feel free to send
me a mail and I'll tell you how I did it.

Normal restrictions? As far as I've heard this means that nobody
outside the UK can use their web page, and non-UK users can only use
their FTP site during evenings (7pm-7am UK time or something like that).

Has any of this changed recently? (I remember using their web page a
lot back in the "good old days")- I guess a lot of other people did as
well, and that's why they put restrictions to it because of the load
on their computer(s).

Yes please- some more German dealer's addresses would be great as I
need to find out about some products that are hard to get elsewhere.
Do you also have email addresses to German Atari dealers? (general
Atari hard/software).

3556. Atari World Shows

Newsgroup: comp.sys.atari.st
Date: 1995-12-11 00:00:00 UTC
From: andrew@ajrose.demon.co.uk
Message-ID: <818680068_OASIS_@ajrose.demon.co.uk>
Source record: 154670

Just a note to congratulate the organisers of the AW shows and say hello to all those who attended the excellent seminars in London (I gather the Brum one's were equally succesful). The opportunity to inform and shape what must surely now be regarded as the UK's premier Atari magazine in this way must surely be unique, and certainly reminded me of the wide range of different people who are still getting the most out of their Ataris, as well as those who've still got much more to enjoy. I hope AW will manage to make this a six-monthly event, and if the editor's reading this - thanks for the pint!

Yep, you will probably get lots of replies to this. Xboot and Superboot will display current running order and allow you to change it. If you do not use a boot manager, then get autosort (latest version is 4.x). Works great. If you have trouble finding it (should be on a good number of ftp and bbs sites), then send me an email and I will send you a copy (it's shareware).

Best regards,

No, doesn't sound familiar. Do you use the correct default settings for
the color table (could be altered in XCONTROL.ACC)?

Yes, I know they are missing. But this is not part of HTML (just one of
the extensions of Netscape). Because most tables look fine without the
cell padding and cell spacing stuff I will do something more important
first ;-)

In article <4agkqu$vlk@news.pacifier.com>,
Michael Kelsey <michaelk@pacifier.com> wrote:

>any one know what this means and what do i need to put where????

(1) check whether there's an assign.sys file in the root directory of
your boot drive
(2) check the PATH line in ./assign.sys. Usually it points to the
gemsys directory on the boot drive
(3) check whether the offscreen drivers and the normal screen drivers
(nvdidrv*.sys) are in the directory that PATH points to

If there's no assign.sys file in the root of the boot drive, take a
text editor and create a new one. For the beginning it should be
enough to insert a line like this:-

PATH=c:\gemsys

Later you may add lines for bitmap fonts, the printer driver, the
metafile and image driver etc.

There is to be an enhanced demo within the next few days. The author has been patiently debugging the program to cope with the many graphics cards now available, and also to speed up the screen displays. Although the displays are still not lightning, the program makes very conservative usage of RAM and also swaps to a harddisk, making it a great package for small memory configurations. What's more, I believe it's the only decent painting/photo retouching program that supports speedo text!
With the authors permission, I will post the latest demo to hensa.micros.ac.uk when available.

There was a product advertised by Gasteiner in the UK at the beginning of
the year which an IDE controller for ST and STE range of computers. It
apparently allows for connection of IDE hard drives. There was another
cartridge based device for connecting IDE CD-ROMS to ST's, STE's and
Falcons. The Price for the Hard Drive controller was 49 UK Pounds for the
ST version, and 69 for the STE version. Dont know if they still sell them
though...

Yup. Not as easy as this. You will have to find a mag. article for
specifics but basically the ACC has to register itself with AES, get all
the store it is likely to need and then sit around waiting for the event
which says it's been
activated.

>Arthur Coddington
>Los Angeles, CA USA

Your problem basically boils down to 'Can you or did you write a DOS boot sector on your floppies?' If yes then your MAC will read them (using a recent version of SYSTEM 7). NEODESK did that automatically. There may be a utility that will do that after the fact without erasing your files but I am not aware of one. I have made this transition ATARI to MAC. At the time the easiest thing for me to do was to upload my files to my internet provider and then download them to my MAC. Good Luck.

3575. .arc files I download extract, but are corrupted... (HELP)

Newsgroup: comp.sys.atari.st
Date: 1995-12-11 00:00:00 UTC
From: miskinis
Message-ID: <3879@epochsys.UUCP>
Source record: 154689

Hi,

I'm working on a SUN sparc5 these days. I have copied a few
.arc files from the web to the sparc5. I then dialup from home,
and kermit them to my Atari ST. I use arcx, and it extracts the
.arc to the individual files, with no complaints.

But, the files are corrupted, even text files such as README files.

Is there an intermediate program I must run on the files at some
point in the process?

Many thanks for any advice,

John Miskinis

From: Alain DERENNES <derennes>
Message-ID: <4ahbil$nvd@melimelo.enst-bretagne.fr>
Source record: 154692

Hello,
in the Auto folder, the programs are executed in the order they are written; to see this order, you must use No Sort instead of By Date or By Name.

To fix the order you want, the best way if to rename the Auto folder, Auto2 or Otto for example, create a new Auto folder and after move the first program to be executed from Otto to Auto, the second and so on ... and delete the empty folder Otto.

Probably you have not more than 16 colors ? In the docs is written, that
the background images are only available with more than 16 colors. Otherwise
with Black and white you couldn't read anything on a dithered background
and with 16 colors ther aren't enough colors free which can be changed.

That's the original distinction. In Germany, a lot of 520's were
sold with 1 MB RAM installed. (Most of the time, they called them
520ST+.)

It does indeed sound like ACN is describing AES 4.1, which is pretty old news. Julian certainly gave us good advice about that, and Bill Rehbock and I were among the people at Atari who worked on it.

Since neither Bill nor I are currently working for Atari, you may safely assume that ACN's information is out of date. I do not know what plans, if any, Atari may have for AES 4.1.

(I've set followups to comp.sys.atari.st, since I don't read .advocacy and the topic doesn't quite seem to fit in .tech.)

You are right. It's a bug in CAB. CAB doesn't use the transparent color for
background images. It's fixed now. Next release will work.

Same here

Also looking for an answer. Meanwhile, maybe ST Format, if they are
reading this, could get their pages exempted from this registration
restriction, so that the like of us (ie those who are likely to
consider buying their mag) can actually access their WWW site. Makes
economical sense: if I see something I like on the web pages, I might
consider trying to track down a copy of the real thing.

Eric Hays (szhays@rocky.ucdavis.edu) wrote:
[snip]
: Would you mind a bit of a wish list? I think you know most of them
: anyway. Support for inline JPEG's, FTP, GOPHER (these last two seemed so
: close even in earlier versions, tantalizing), and MAILTO. Of course, the
: ability to download files (the JPEGS or even .ZIP files people have
: linked to their HTML pages) would go a little way towards easing two of
: those needs. External programs like duFTP and ANTMAIL might work for
: two of them (except linking to external programs hasn't worked for me, I
: tried having the Apex viewers load the JPEG files, which used to work,
: but doesn't with the newest CAB, CAB tries to read the file in stead of
: just downloading it and passing it on the the external program. Same
: with using ST-ZIP as an external program for .ZIP files [see, I'm trying
: to work around that lack of FTP]).
[snip]

I haven't got CAB working online yet (no modem!), but these sound like
the most useful additions (better than extra Netscape HTML stuff, and
maybe even better than HTML 3 stuff). For a start with FTP and gopher,
how about using them if the proxy supports it?

The standard HTTP proxy returns normal FTP and gopher directories as HTML
code! Surely this would make supporting these two protocols trivial?

BTW, does CAB use MIME types, or just the file extension?

I bet you read that in the ACN mag. I've seen it too - it looks suspiciously much like they've got a copy of AES 4.1. All the features they mention are in that. AES 4.1 is, however, not completely bug-free (and not `completely legally' available...) but there is now N.AES, fully compatible with it, and (hopefully) soon XaAES by Craig Graham, which will be published under GPL. (How's it going, Craig?) I will probably get them both.

PS. don't believe everything ACN says. There are often blatant errors and nonsense in their reviews.

PPS. Julian Reschke, are you reading this? Your name was mentioned in that article as `one of the advisors' of Atari's programming team making MultiTOS II, which allegedly had Eric Smith and Bill Rehbock (or that other famous Atarian) in it. How much is true of that?

They're simply too big.

Last week I tried to reduce the entropy in my room by rearranging some old magazines
that were lying around on the floor. I had a quick look into some of them and there
was an interesting article from 1991 about Objective-C for the Atari. It wasn't a
stand alone compiler but more kind of a preprocessor which translates Objective-C
into 'normal' C to be compiled using a C compiler. I haven't heard of this anymore
so I believe it's not available either ...

mbecroft@iconz.co.nz (Mario Becroft) writes:

>I have just tried to boot from two different Quantum Fireball 1080 SCSI
>hard drives.

The Atari can't boot from Fireball drives at all. This is not a driver problem but a TOS problem. The Fireball requires initiator identification, i. e. the TT must have a SCSI ID of its own to communicate with this drive. TOS doesn't support initiator identification. Hard disk drivers that support bus arbitration (HuSHI, HDDRIVER) also support initiator identification and so you need one of these drivers for the Fireball. But even with these drivers you won't be able to boot from this drive because the very first sector is always read by TOS directly.

3598. Casio/Atari outrage - help!!!

Newsgroup: comp.sys.atari.st
Date: 1995-12-11 00:00:00 UTC
From: andrew@ajrose.demon.co.uk
Message-ID: <818680430_OASIS_@ajrose.demon.co.uk>
Source record: 154802

After tracking down a german PD prog to read/write data to my Casio SF electronic diary thingy (big thanks to Mick Lock), I rang Casio in London to enquire about getting the necessary lead.

Guess what? They only sell the lead bundled with Windows software, which bumps the price up to a cost greater than that which I paid for the machine in the first place. I explained that not only was the software completely useless to me, but that I already possessed the necessary program. Alas, the licensing agreement with the software writers includes a clause which prevents Casio from selling their own lead on its own!!!

There is some light in this tale, however. Off the record, the guy at Casio informed me that details of haw to make up the necessary interface is available on the internet. Where? I asked. On Compuserve, he replied. Great. I've not got a Compuserve account, and it seems a little extravagant to acquire one for this purpose alone.

So....is there any sympathetic Atarian out there accessing Compuserve who could dig out the necessary file and mail it to me? Not sure if that's strictly within the rules of Compuserve, but I promise I won't tell anyone :-).

From what I recall, it's to be found on the BOSS (ie. American for Casio) section of the DATABANK (or is it DATAFILE) forum. I guess it's a matter of getting the signal out of the Casio, amplifying it to a useable level, then putting the right leads tot he right pins on a serial port connector. Not the sort of thing I'd like to try without instructions!

Hope someone can help

Andrew

3601. GEM for PC Gold Pack - Rare, Unopened and Cheap!

Newsgroup: comp.sys.atari.st
Date: 1995-12-12 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DJHD95.24B@freenet.carleton.ca>
Source record: 154455

As some members of USENET readers may know I've done a fair amount of
experimenting with the Atari Desktop's first cousin, GEM for the PC.
This software product (by the same people as wrote GEM for the Atari) makes
a humble DOS machine launch programs, copy files and generally operate
just like an ST.

The big difference is that the PC runs IBM applications not Atari programs.
In other words, instead of clicking on the name or icon for Word Perfect 4.1
for Atari, you do the same deal and launch WP 6.0 for DOS. The new desktop
on your PC looks very similar to that of your ST.

GEM for the PC runs any IBM compatible application what can be run from the
DOS prompt (even those that won't run in Windows or under DOS Shell).
Additionally, it can run special GEM for PC applications which take advantage of
this interface's common font sharing capabilities, desktop accessories, etc.
(like those of the ST).

Recently, I was fortunate enough to have a chance to buy six unopened copies
of this software, dating back to the final release of this software (in 1989).
All are unopened and include original licences and original 3 1/2 726K disks.

The package consists of the GEM for PC Desktop software itself (a three disk
set), plus seven native GEM for PC applications, as follows:

GEM Desktop Publisher - a two disk set similar in characteristics to Timeworks
Publishing Partner, but with a lot more zap; at least when run on a 386.

GEM Graph -

GEM Word Chart - Posters, maps, graphs, etc.

GEM Draw Plus - Advanced drawing capabilities

Bitstream Fontware - Same fonts as featured on the ST (Dutch, Swiss, etc.).

Bitstream Fontware Installation Kit for GEM 3, and

GEM Filter Pack PCX to IMG and IMG to PCX - this one runs even on PCs
that don't have GEM Installed. Great for people who want to get new PCX
files, from the IBM, world into their ST.

I got a good deal on this stuff from a friend and am willing to pass the
savings along to any interested USENET readers and "cling-ons". Specifically
I'm selling these unopened Gold Pack sets (11 disk packages) for US$35 each!

If anyone is interested I'll also include a copy of the earlier version of GEM
for the PC which is a dead ringer for the original ST Desktop (but which
displays in lower resolution than GEM for PCs version 3 and which can't run

all of the noted GEM-native applications, included in the Gold Pack).

If you've got to use a PC at work or home, you might as well make the most of it. GEM for the PC is a step in the right direction. Once these six copies are gone, they are gone, so if you are interested, let me know soon.

Thanks

3603. Printerdrivers HP600

Newsgroup: comp.sys.atari.st
Date: 1995-12-12 00:00:00 UTC
From: lwillems@eduserv.rug.ac.be
Message-ID: <4ajc9c$dtb@infoserv.rug.ac.be>
Source record: 154457

Hello,

I recently bought a brand new HP deskjet 600. It is a wonderfull printer for use at home. Unfortunately, I don't have a good (means working) printer driver for this printer for every program I use regulary.
Could someone tell me where to find drivers for Calamus, Arabesque (a drawing program), Le Redacteur (a french word processor) and a suitable GDOS driver for my printer (preferrably on the net).
This way, I won't have to buy an IBM PC because I can't use my new printer on my ATARI and I can go on using my ATARI for (many) years to come.

Thanks in advance

Lieven.

: outside the UK can use their web page, and non-UK users can only use
: their FTP site during evenings (7pm-7am UK time or something like that).

Sorry, but I am in USA, and I access the page every day. Access restrictions means you can only access it between 6pm and 6am. Works fine and dandy for me.

Oooohhh... it's been a long time since I used HiSoft BASIC :) Last time
was for my A-Level Computing project I think... Scary :)

Okay, if my memory serves me right (which is getting very rare nowadays),
if you quit the program with the statement SYSTEM instead of STOP, then
it will quit straight out and not print that silly little message.

Best o' Luck with your programming, and a very happy Christmas :)

Neil.

Well... you only need to make partitions of 32 Mb and read it with PC exchange
on the Mac. I'm changing data with a Mac through a 128 Mb Magneto Optical drive
on this way. I ald
I also have done the same with a single 44Mb partition on a Syquest removable
media. It works well with ICD hard disk driver on the Atari.
i hope this helps!

> Does anybody have any recommendations for video add-ons for either
> machine? In particular, do they work with Linux/68k?

falcon and Blowup work with Linux/68k , there is however some problems
with the external dot clock and all hell breaks loose on the scsi bus
is you dare to attempt to set a higher than 800*600 or thereabouts in
256 colours.

support for the external clock was supposed to be on the way.

I don't know about the nova card in particular but I think videocards
in general seem to be far from easy to set up currently.

ICD should do, probably cost you about 5 bucks though. You said you didn't like
the aplication software, well I don't know if you mean the driver or the
associated apps but they don't come much more comprehensive than the ICD lot.
The ICD Driver is by far one of the fastest and probably the best but I use HD
Driver which is a tad faster so that I can get multitasking DMA with Magic 4.
Hope this helps.

I still have mine too, and I DON'T intend to sell it for a long time (= never).

I don't know what _new_ second machine I wanna buy, the computermarket looks very turbulent at the moment and my Falcon does the VERY well for now. The Pentium may look interesting at the first glance, but than again - what about the future if this Intel-platform (and Windows95 is soooo heavy). I mean the PowerPC based machines are much faster and I should think that they will become more and more dominating by the time.

To buy a new computer now just for changing, seems quite stupid to me, since it's very uncertain what will happen in the future. So I'll stick with my Falcon for a good while, until something extremely interesting appears.

Atari may not support the Falcon anymore, but others do and as long as that's the case I don't see any problem in having and using/abusing :-) a Falcon, 'cause it's a damn fine machine. Decent graphics, GREAT sound etc.etc.

Maybe I'll buy a second hand 486PC somewhere for games and some special programs, but I prefer using my Falcon. MagiC 4 is very compfortable to work in and multitasks like nothing I've ever seen on the Atari before, actually the effeciency of MagiC reminds me of AmigaOS (yes, you heard it right). AmigaOS has always been fast and very multitasking capable, it's just a shame that the corresponding platform has such outdated chipset (video, sound etc.) otherwise a pretty cool machine too.

Anyway - What were we talking about ? :-)

Keep Cool and Flying...

Hi,

This may be a moronic question but is it possible to access the same hard drive from two separate STs?

I'm a musician and have one ST which I use for sequencing and a second one I use for sampling (Replay 16). I'd like to be able to access the one hard drive I've got (MiniS with ICD link) with both STs at the same time. Can this be done and how?

Help appreciated.

Daniel

With the package you should find a folder called RSC. In this folder are several resource files in different languages - I think the English one is CAB_E.RSC - simply copy this over the original one and, hey presto!, you have an English version!!!

Cheers, and a 'frohe weinachten'!

The program you want is "Autosort".

ftp://atari.archive.umich.edu/atari/Utilities/autosort.arc
or
ftp://ftp.cnam.fr/pub/atari/Utilities/autosort.arc

That's about the most obvious places to get them. If you can gopher or
WWW to "micros.hensa.ac.uk" then you can go into the micros archive, and
into the atari-TOS section, and do a search for "autosort".

The program is a piece of cake to use, just drag the programs into the
order you want and click "sort", no flowery pointless extras.

ISTR that it was HiSoft that got the apology - and the orders for manuals (etc) had to be passed onto them... I think HiSoft had copyright on much of the translations to English. Probably something along the lines of HiSoft having UK distribution rights and Compo having Europe!

In a msg of 11 Dec 95 rmccall@mcs.dundee.ac.uk peeled off everything to reveal:

> Am I the only person round here who isn't trying to sell their Falcon?
> Eveyone else seems to be.

I put mine up for sale because of money problems - exactly a day later I get offered a job up in Dundee
:-)

So the Falcon doesn't need to get sold
:-)

Brian (soon to be moving to Dundee - Hurrah!)

3629. STiK and IRC

Newsgroup: comp.sys.atari.st
Date: 1995-12-12 00:00:00 UTC
From: simon@orme.u-net.com
Message-ID: <818804056_OASIS_@orme.u-net.com>
Source record: 154483

Is anyone using STiK/IRC?
The servers I try don't allow me on.
I've tried those in the cfg file and undernet without success.
My provider doesn't have it's own IRC server....

Any help appreciated..

Cheers,
Smn..

3633. Problems decoding MIME

Newsgroup: comp.sys.atari.st
Date: 1995-12-12 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <30ccff30bccc5c4@sn.no>
Source record: 154487

I just recieved a MIME encoded message from someone, and I've been
trying to convert it back to it's original form using "Esscode 6.4",
but have had no luck so far.
(By the way, is version 6.4 the latest one?)

It keeps telling me that it'll overwrite an existing file with the
same name. I've tried giving different names to the target file, but
nothing has resulted in a proper conversion. What am I doing wrong?
I'd prefer UUencode instead, but I really do need to decode the file I
got.
Maybe it isn't even MIME?..... I got an email from someone else, and
it looks like this:

```
--------------
[part of header snipped]
..........
In-Reply-To: <30c9827a6451b33@sn.no>
Message-Id: <Pine.HPP.3.91.951211125658.13823B-400000@hp825.lhg.hib.no>
Mime-Version: 1.0
Content-Type: MULTIPART/MIXED; BOUNDARY="0-851401618-818683336=:13823"

This message is in MIME format. The first part should be readable text,
while the remaining parts are likely unreadable without MIME-aware tools.
Send mail to mime@docserver.cac.washington.edu for more info.

--0-851401618-818683336=:13823
Content-Type: TEXT/PLAIN; charset=US-ASCII
Content-Transfer-Encoding: QUOTED-PRINTABLE

[email message snipped.....]

--0-851401618-818683336=:13823
Content-Type: TEXT/PLAIN; charset=US-ASCII; name="internet.txt"
Content-Transfer-Encoding: BASE64
Content-ID: <Pine.HPP.3.91.951211130216.13823C@hp825.lhg.hib.no>
Content-Description:

RnJvbSBubnRwLWJlcmdlbi5VTklORVRULm5vIW5udHAtdHJkLlVOSU5FVFQu
bm8haHA4MjUha2oxMTEgV2VkIERlYyAgNiAxMzo0NTo1OSAxOTk1DQpQYXRo
OiBubnRwLWJlc

[rest of MIME encoded file snipped..]
```

Esscode does have MIME support, but is it somewhat incompatible with a
file like this?
Are there other programs better suited for it?
I guess I could ask this person to send me a new mail in another

format, but it wouldn't solve this MIME thing for later in case I got
more mails with it.

SOFTWARE/DATA PROCESSING/COMPUTER
PROFESSIONALS

$25-85,000/YEAR

If you are considering a job change, your technical expertise
deserves expert representation. Our staff knows the marketplace and
understands the current trends in technology. We are now actively
recruiting candidates for the following positions (partial list only).

VISUAL BASIC PROGRAMMERS - Join a visually oriented development team. 2
years VISUAL BASIC and MICROSOFT SQL-SERVER. Salary to $70,000 + Bonus
(Contract Available). (Jr. positions available for lesser experience).

SOFTWARE ENGINEERS - Extensive X or MS-Windows, C or C++ and any
Multimedia or related experience (Voice, Video, Full Motion Graphics,
Animation, Self Service or KIOSK). Learn Multimedia. Salaries to $70k.

MAJOR DATA CENTER EXPANSION - Computerworld Premier 100 firm seeks IBM
Mainframe OS, COBOL development skills. Programmers through Systems
Managers. Salaries to $45k-100k. (Contracts Available).

C++ SOFTWARE ENGINEERS - Expanding opportunities for software
professionals with 2-10 years of experience which includes experience
with C++. BS degree highly preferred and either UNIX, MS-DOS or OS/2
experience. Compensation from $42,000 to $75,000.

SOFTWARE QA - 5 clients need software QA Engineers with BSCS/EE and 4+
years experience in QA. Test and Release related to Communications,
Networking or Graphics. Desire C, UNIX, MS-DOS, C++, Run-time,
Debuggers, Interpreters. Salary to $40-62k.

REAL-TIME COMMUNICATIONS - Develop communication products for this
growing start-up. Requires C, embedded software, X.25, TCP/IP or CODEC.
Salary to $45-65k.

IMAGING - Systems Engineer with Software/Hardware background
Multiplatform software experience required to build a large image
processing system. BS required. Salary to $60,000. Also QA/Test Tools
position available write "C" code Multiplatform Tools. Salary to $50k.

PROFESSIONAL SERVICES/BIG 6 - A variety of positions are available for
systems professionals able to bridge the gap between technology and

business. Experience with CASE tools/systems analysis is necessary. A Big 6 background or top level technical and professional skills are needed. Salary to $85,000.

BUSINESS PROCESS/INFORMATION ENGINEERING - A Fortune 50 telecommunications firm is building a new organization to re-engineer its business lines. Seeking top executives at Vice President, Director, Program Manager and Senior I.E. Architect levels with world class backgrounds. BPE, IE or CASE experience required. Salaries to $115,000.

DATABASE - 3-8 years Relational and Object Oriented Database experience with SQL, C, Client/Server. Windows experience is a plus. Salary to $65,000.

STRATUS DEVELOPERS - Learn UNIX! Great opportunity for C, PL/1 or COBOL STRATUS developers to move to a SUN/UNIX environment. Salary to $50,000.

NOVELL LAN ADMINISTRATORS - Learn wide-area networking. Requires 3 years PC application support some programming and NOVELL 3.11. Salary to $43,000.

PARADOX SYSTEM ANALYST - 2+ years of Application Development using PARADOX or related XBASE, MS-WINDOWS a plus. Opportunity to do high level system consulting. Salary to mid $40's.

LAN/WAN NETWORKING SOFTWARE ENGINEER - LAN/WAN Networking Software Engineer with BSCS and 4 years experience in C/UNIX for Driver, PROTOCOL applications. Salary to $50k.

MACINTOSH SOFTWARE - With 3+ years experience in image and text processing using MPW, "C", and C++. Salaries to $65,000.

C++/GUI SOFTWARE DEVELOPMENT - Firm seeks MS-WINDOWS and C++ experience for new development effort. Object oriented methodologies, MS-DOS, DDL and DDE experience preferred. Salary to $70k.

SOFTWARE PHONE SUPPORT - 0-3 years experience to provide software phone support. Requires C/DOS, NFS, TCP/IP, OS/2 and/or File Transfer Protocol experience. Similar skills also required for a development role. Great Company.

MAJOR DATA CENTER EXPANSION - 40 POSITIONS! IBM, OS/COBOL, CICS, DB2. Two of our major clients are expanding the mainframe side of their client/server application base. You'll need 2 years OS/COBOL programming with either DB2 or CICS. Great opportunity to learn PC's networking and data analysis! Salary to $55,000.

AS/400 - 25+ openings! Many of our client companies are seeking 2+ years experience with RPG III, CL and SUBFILES. $25-55,000.

Candidates interested in these positions please send resume to:

3635. Atari Clone Names

Newsgroup: comp.sys.atari.st
Date: 1995-12-12 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4aiunk$764@inca01.inca.co.nz>
Source record: 154608
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Has anyone noticed that the names of Atari clones are based on old (usually Greek) mythology?

For example, take Medusa. She was one of the three Gorgon sisters [Stheno, Euryale, Medusa] with snakes for hair that would turn you to stone if you looked at her.

Or, for that matter Hades.

Hades :
"(1) The gloomy subterranean abode of departed spirits or shades over which Pluto [lord of the underworld] ruled.
(2) [in the Revised Version of the New Testament] the abode or state of the dead.
(3) [colloquially] Hell"

Not an exactly warming name for the product, is it?

if you were to buy a computer, and were given three choices 1) Model 2349/23A, 2) "Medusa" or 3) "Hades", which would you pick?

If it were me, I would shy away from the negatively-named products.

And what is wrong with using names from Greek mythology that have positive names? "Zeus" [the chief god of the Ancient Greeks, ruler of the heavens] for example?

Only if the games are more fun to play, what good is buying a $300
machine if the games are crap? I'm surprised that no one ditch the new
systems and decided to buy a 2600 at a flea market instead :)

I have a system that I would like to sell, preferably as a whole, but I
will break it up if necessary. I have:

Atari 1040ST, 1 meg, mouse
Atari SC1224 color monitor with stand
Atari SX212 1200bps modem (blazing speed, eh?)
Atari SF354 single-sided external floppy drive
Gemini 8-pin dot matrix printer
All necessary cables and adapters

Everything is working 100% and in the original boxes. Make me an offer:
this thing is gathering dust in my closet, and I want to get rid of it.
Payment and shipping arrangements will be made when we make a deal.

If you reply to chris@flowerslabs.com, you'll get a slightly faster
response than from cjg48647@pegasus.cc.ucf.edu.

3639. Broken Falcon mother board?

Newsgroup: comp.sys.atari.st
Date: 1995-12-12 00:00:00 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <4akcls$2kj@lyra.csx.cam.ac.uk>
Source record: 154612
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Help!

A long time ago, I posted about the problems my falcon was having.
Well, I have finally got round to getting it fixed and put into a tower case.

The symptoms

At first, on booting, the display would be corrupted (various multicolour pixels appearing all over the place). This got progressively worse and eventually it would hang up.
Then it died. Turning on the power would just make the PSU buzz and nothing else.

The diagnosis

So, I thought I needed a new PSU. I have just had the old one checked by our computing department and they say it's fine.
This (presumably) means it is a more serious problem, probably on the mother board itself.

They did suggest removing all floppies and hard disks one at a time and seeing if that made any difference.
I will try this today, but I am not too hopeful.

Does anyone know what may be wrong?

Thanks for any help,
Phil

Hello.

I am looking for an affordable second-hand copy of Cubase
that will run on the Atari TT. As far as I know, each of
Cubase 3.0, Cubase Audio Falcon and Cubase Lite will do this.

Does anyone by any chance have such a copy they would like
to sell?

I live in Amsterdam. Please reply by mail.

As regards to Expose and Apex ... I tested Apex v2.16 and it works fine on the
Afterburner040.
Expose should work as the internal expansion isn't taken up ...
(I don't think Expose has been tested fully but in theory it should work fine
with the board)

3645. Re: Connecting PC IDE HARDDISK to STe

Newsgroup: comp.sys.atari.st
Date: 1995-12-12 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <30cdbc541508db72@sn.no>
Source record: 154618

> Is it posible to connect
>a PC IDE HARDDRIVE to my 1040STe, and if so, how?

Yes, it should be as I've seen several ads for IDE interfaces, but nothing concrete actually. I've been going on about this matter for over a year now, trying to get in touch with the various German firms that make these interfaces but they're obviously not interested in doing business, or the whole advertising thing is a hoax!

But... it is possible to add an IDE drive to the older ST models for some reason (ST, STF, STFM).

I eventually gave up the whole IDE thing for my STE and got hold of a cheap, used "ICD Link II" (DMA to SCSI interface) and a big (but bulky and noisy) old SCSI harddisk.

Does anyone know anything more about IDE interfaces for the STE?

: > being loaded from the AUTO folder? Thanks.
: >
: There are several free/shareware programs about which will allow you
: to sort your Auto folder (autosort comes to mind). Neodesk (tm) from
: Gribnif has this facility built in.
: Failing that, rename your Auto folder to something else, create a
: new Auto folder, then copy/move the programs over one by one in the
: order in which you want them to execute, as TOS/GEM execute Auto
: programs in the order in which they appear in the Auto folder.
: Finally, delete the old folder.

: Hope this is of some help

Nobody has mentioned the new program: dirsort.prg

It's much the same as autosort but it will sort the order in any
directory. It's also very intuitive. Available on hensa.micros.ac.uk

Best wishes

Neil

>clone, not a 3.xx clone.

Wizztronics is thinking about making a Falcon clone? Geez, I wished I knew
about this when I went to the Toad Holiday Fest. I think they were there and
I could have asked them some questions. I hope they make the system board
in a Baby AT form factor so people can put it into a standard PC case. I
much prefer those cases to the musician oriented rack mount cases I've
seen for the Falcon.

>I think I've seen Atari World at the computer store that sells ST Format,
>but they don't have AW anymore. The only Atari magazine I can get is
>STF.

You should be able to subscribe to AW if you want to. According to the
latest issue, issue 9 (January 1996 :-)):

3 issues without disk rest of world price: 14.50 ukp
3 issues with disk(s) " 19.00 ukp
13 issues without disk " 58.00 ukp
13 issues with disk(s) " 76.00 ukp

AFAIC you should be able to find much of the stuff on the reader disks at
some site or other, so you only really need the mag. 58.00 ukp = approx 90
usd, so 90.00 usd would get you 13 issues. According to the ad they accept
Visa and Mastercard, so if you wanted to you could do it that way.

You can e-mail AW on atari_world@cix.compulink.co.uk , but i'm sure
there's an admin address as well.

Mal

Excuse me but...isn't the purpose of the Atari community is to keep Atari products and support going? I've heard some flaky ideas before but this one takes the cake.

I seen Dactal Nightmare on a TV program about using VR. It reminds me of
Doom, but it moves way slower. Now if Atari can get the VR games to move
like the Sega arcade games, then we can have something here. (I hope
Atari will make them fun, unlike the Sega games).

> ii) Atari are going into the PC games market, because there is a lot of money

Sega is also moving into the PC field as well, but it's mostly
translations of Sega CD games. I hope Atari does well on PC games since
hopefully I should get a 486 myself(with proper ST emulation of course :))
But what I would really like to see is the Jag card that plays the Jag
CD's on the PC. They won't release it until there are a number of good
CD games out, you here this Tramiel!! I love to see T2K as a CD package
with the card. :)

> Another thing to note is that the Jag is a lot

Atari should support the UK as it had a great marketing base in Europe
for the ST. The Japanese systems are always first in Japan with months
delay in America and Great Britian(some games are made right in those
countries however). Other than trans-ocean shipping, there shouldn't be
any problems with Britian getting the Jags soon.

Just some of my observations...

Still better:
1. copy the file CAB_E.RSC to your CAB.APP-folder
2. delete the CAB.RSC file from that folder
3. rename CAB_E.RSC to CAB.RSC (CAB.APP is looking for precisely that name;
the extension _E is just a hint to the language; the French language RSC-file
is called CAB_F.RSC, the German one CAB_D.RSC)

Regards,
Marc.

MagiCMac used to work on a IIcx, but I haven't checked the latest version. Mode32 should be available from Apple dealers and from many PD CD-ROMs and FTP servers, too.

3658. Play Long Samples and Animations within Apex Media!

Newsgroup: comp.sys.atari.st
Date: 1995-12-12 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4akdjl$5h5@huron.eel.ufl.edu>
Source record: 154631

Dear amigos (friends) and Apex Media users:

Stereo Sampling Playing within Apex Media!

I am very exited about my experiments with Apex. I liked Apex very much, but was not happy that I could not play the animations with sound. I realized that Apex played 256 colors animation in full screen at very fasts speeds and had a thought -If only I could play these filcs from my CD and have some nice samples play alone!

I wrote e. mail to several people and they told me that it was virtually impossible for the Falcon to do such a thing. I refused to believe it because I have a friend who has a Pentium and we compare the two machines and my Falcon can play the FLC at the same fast speeds believe or not!
